Dear Jason:

On behalf of Northrop Grumman, Arcadis is providing the NYSDEC with the Second Quarter 2022 Operation, Maintenance, and Monitoring Report (Report). This Report was prepared to document the operation, maintenance, and monitoring (OM&M) activities conducted for the Operable Unit 2 (OU2) groundwater remedy and the results of ongoing volatile organic compound (VOC) and inorganic monitoring in groundwater to meet the remedial objectives set forth in the March 2001 OU2 Record of Decision (ROD) and associated December 2019 Amended Record of Decision (AROD).

Table 1 summarizes OU2 remedial system performance operational data, mass removed, and water balance. **Tables 2 and 3A/3B** provide the analytical results for remedial system water and vapor samples, respectively, for this period. **Tables 4A and 4B** provide the air modeling inputs and outputs and resulting analyses based on quarterly vapor samples collected from the Tower 96 and Tower 102 systems, respectively, for this period. **Tables 5A and 5B** provide a summary of percent mass emittance of TCE from vapor sampling completed during the Third Quarter 2021 through the Second Quarter 2022. **Table 6** provides validated analytical results associated with groundwater monitoring efforts completed during this period. **Figures 1 through 3** show the Locations of Wells and On-site Groundwater Remedy, ONCT Groundwater Extraction and Treatment System Site Plan, and the ONCT Groundwater Extraction and Treatment System Schematic, respectively.

As indicated on **Table 5A**, the 12-month rolling average of the percentage of allowable TCE emissions at the Tower 96 system was at greater than 100%; however, the Rule 212 compliance limit for TCE was not exceeded.

Jason Pelton
NYSDEC

Table 1
Operational Summary for the Treatment System
Second Quarter 2022⁽¹⁾ Reporting Period
Operable Unit 2
Northrop Grumman
Bethpage, New York

Notes and Abbreviations:

- (1) Quarterly reporting period: April 1, 2022 through June 30, 2022.
- (2) "Current Model Design" flow rates were determined for the five remedial wells and for the South Recharge Basin based on computer modeling (ARCADIS G&M, Inc. 2002, updated in 2021). Flow rates for Calpine Power Plant (Calpine), Occidental Chemical (OXY) Biosparge, and West Recharge Basin flow rates are typical flow rates and are provided for reader information. "Design" flow volumes represent the volume of water that is expected to be pumped/discharged during the reporting period and is calculated by multiplying the design rate by the reporting period duration.
- (3) Actual flow rates for the remedial wells represent the average actual pumping rates when the pumps are operational and do not take into account the time that a well is not operational. Actual flow volumes are collated from the monthly SPDES reports, which are calculated using the SCADA instantaneous flow rates transmitted from local flow meters.
- (4) "Actual" flow rates for the system discharges represent the average flow rate during the reporting period and are determined by dividing the total flow recorded during the reporting period by the reporting period duration.
- (5) The TCE and TVOC concentrations are from the quarterly sampling events performed during this reporting period on May 17, 2022.
- (6) The TVOC concentrations for the West Recharge Basin (Outfall 006 of the Tower 96 System) and the South Recharge Basin (Outfall 005 of the Tower 102 System) are their respective average monthly Outfall SPDES concentrations for the current quarter.
- (7) Tower 96 (Wells 1 and 3R) was shut down this reporting period to accommodate the replacement of vapor-phase granular activated carbon (VPGAC) in both exterior VPGAC emissions control units, and other smaller-scale repairs. As such, the system was shut down approximately 2 days in April and approximately 1 day in May.
Tower 102 System was shut down this reporting period for smaller-scale repairs. As such, the system was shut down approximately 2 days in April and approximately 1 day in May.
- (8) Total pumpage/recharge rates are accurate to ±15% based on available information and expected or typical precision/accuracy factors for the gauges and meters.
- (9) There are four possible discharges for the effluent groundwater: South Recharge Basins, West Recharge Basins, Calpine, and the OXY Biosparge system. Treated water is continuously discharged to the south and west recharge basins during routine operation, and is available "on-demand" to both Calpine for use as make-up water, and the OXY Biosparge remediation system. For this quarter, the quarterly flow rates to the south and west recharge basins (SRB and WRB, respectively) were calculated using the remedial well flow rates and available additional information and assumptions provided by Northrop Grumman regarding flow distribution, as follows: the Tower 96 system (Remedial Wells 1 and 3R) discharges effluent water to the WRB, less Calpine usage and less 119 gpm of Tower 102 steam condenser usage (15.8 MG); the Tower 102 System (Remedial Wells 17 through 19), including the Tower 102 steam condenser usage (15.8 MG), discharges effluent water to the SRB.
- (10) Oxy has not reported any water usage for the OXY Biosparge system since May 2016.
- (11) Storm water runoff volume is calculated by multiplying the adjusted tributary area and NOAA precipitation data for the reporting periods. The tributary area is adjusted by the runoff coefficient to exclude the infiltration volume from the total rainfall volume. The tributary area, runoff coefficient, and adjusted tributary area are from Dvirka and Bartilucci Consulting Engineers' Storm Water Permit Evaluation Report (January, 28, 2010). The NOAA precipitation data are calculated as a sum of NOAA daily precipitation data for the reporting period. NOAA precipitation data are retrieved from Station GHCND:USW00054787 - FARMINGDALE REPUBLIC AIRPORT, NY US for April, May, and June 2022.
- (12) Total flow volume to South Recharge Basins is estimated as a sum of flow volumes contributed by the effluent groundwater to South Recharge Basins and from storm water runoff to South Recharge Basins. Second Quarter 2022 calculated South Recharge Basin flow volume is within historical operating range.
- (13) Treatment system efficiencies are calculated by dividing the difference between the remedial well flow weighted influent and effluent TVOC concentrations by the remedial well flow weighted influent concentration.

Table 2
Concentrations of Constituents in Remedial Wells and Treatment System Effluents
Second Quarter 2022⁽¹⁾ Reporting Period
Operable Unit 2
Northrop Grumman
Bethpage, New York

Notes and Abbreviations:

- (1) Quarterly reporting period: April 1, 2022 through June 30, 2022.
- (2) Results for the program are validated at 20% frequency, per protocols specified in OU2 Groundwater Monitoring Plan (Arcadis 2016).
- (3) VOC samples analyzed using USEPA Method 8260C. 1,4-Dioxane samples analyzed using USEPA Method 8270D-SIM.
- (4) TVOC concentrations are rounded to the number of decimal places of the individual VOC with the least numerical precision (decimal place), including whole numbers with no decimal place.

5.5	Bold value indicates a detection
< 0.5	Compound is not detected above its laboratory quantification limit
µg/L	micrograms per liter
J	Compound detected below its reporting limit; value is estimated
ND	Not detected

Table 3A
Vapor Sample Analytical Results,
Tower 96 Treatment System,
Second Quarter 2022⁽¹⁾ Reporting Period
Operable Unit 2
Northrop Grumman
Bethpage, New York

Notes and Abbreviations:

- (1) Quarterly reporting period: April 1, 2022 through June 30, 2022.
- (2) Vapor samples collected by Arcadis on the dates shown and submitted to a NYSDOH ELAP certified laboratory for VOC analyses per Modified USEPA Method TO-15.
- (3) TVOC concentrations are rounded to the number of decimal places of the individual VOC with the least numerical precision (decimal place), including whole numbers with no decimal place.
- (4) The system was reconfigured to bypass the regenerative vapor-phase GAC components and treat air stripper effluent directly through the exterior VPGAC emission control units on 3/15/22.
- (5) T96 vapor-phase influent concentrations for the May 17, 2022 sample were uncharacteristically low and well below the expected concentration range, with midfluent and effluent concentrations on the lower end of the expected concentration ranges. The analytical laboratory indicated no issues with the sample analyses.
- (6) During this quarterly reporting period, monthly air samples were collected for laboratory analysis of VOCs as part of an enhanced sampling program implemented to more closely monitor T96 following its reconfiguration to eliminate the regenerative VPGAC components of the system. As a conservative "worst case" scenario, the sample exhibiting the greatest TVOC concentrations in system effluent from the three monthly samples (6/17/22) will be compared to the Rule 212 compliance limits.

Flowrates and Normalized Modeling Impacts			
Description	Flow (cfm)	AERMOD Normalized Ambient Impact at 1 g/s	
		Hourly ([μg/m ³]/[g/s])	Annual ([μg/m ³]/[g/s])
Tower 102	7,530	348.9	2.3

Notes:

1. Quarterly reporting period: April 1, 2022 through June 30, 2022.
2. High toxicity air contaminant (HTAC) based on 6 CRR-NY Rule 212-2.2, Table 2 – High Toxicity Air Contaminant List.
3. Maximum effluent concentrations based on sampling performed in 2022. Compounds not detected above the laboratory reporting limit are excluded from the air quality impact analysis summary.
4. Total for xylenes m, o, and p.
5. Emission rate calculated based on maximum effluent concentration and maximum air flow rates measured during the sampling events. Emission rate standardized at 70 °F and 1 atm.

Trichloroethylene (lb/yr) = Trichloroethylene [μg/m³] x Air Flow Rate [ft³/min] x (1 m³/35.3147 ft³) x (60 min/hr) x (0.000001 g/1 μg) x (0.0022 lb/g) x 8,760 hrs/yr

6. 100 lb/yr for non-HTACs, and mass emission limits based on Rule 212-2.2, Table 2 for HTACs.

7. For HTACs, no further demonstration is required if the actual emissions are less than mass emission limit. For non-HTACs, no further demonstration is required if the actual emissions are less than 100 lbs/yr.

Table 5A
Summary of TCE Mass Removal
Tower 96 Treatment System
Second Quarter 2022 Reporting Period
Operable Unit 2
Northrop Grumman
Bethpage, New York

Date	TCE Concentration ($\mu\text{g}/\text{m}^3$) ⁽¹⁾			TCE Mass Emission ⁽²⁾ (lbs)	Percent of Allowable TCE Emissions ⁽³⁾ 12 Month Rolling Average ⁽⁸⁾
	T96 INFLUENT	T96 MIDTRAIN	T96 EFFLUENT ⁽⁵⁾		
8/31/2021 ⁽⁴⁾	18,100	14,800	5,250	256.0	88.1%
11/11/2021	10,000	8,650	81	2.6	57.2%
2/16/2022 ^(6,7)	5,430	2,580	10,900	466.9	147.7%
6/17/2022 ⁽⁹⁾	13,400	742	24.0	1.1	143.8%

Notes and Abbreviations:

⁽¹⁾ Vapor samples collected by Arcadis on the dates shown and submitted to a NYSDOH ELAP-certified laboratory for VOC analyses per Modified USEPA Method TO-15.

⁽²⁾ TCE Mass Emission calculated based on the exhaust air flow rate on the day of sampling and the period of time since the preceding day of sampling. TCE (lb) = TCE Concentration [$\mu\text{g}/\text{m}^3$] x Days x Flow Rate [ft³/min] x (1 m³/35 ft³) x (60 min/hr) x (24 hr/day) x (0.000001 g/1 ug) x (0.0022 lb/g)

⁽³⁾ Percent of allowable TCE emissions to date is a time-weighted annual rolling average based on the 500 lb/year mass emission limit specified in the CRR-NY 212-2.2 Table 2. High Toxicity Air Contaminant List, revised February 15, 2021.

⁽⁴⁾ Given that Q3 2021 TCE aqueous-phase influent concentrations are comparable to typical concentration ranges observed over the last two years, it is unclear what caused this elevated vapor-phase concentration. Northrop Grumman inspected the VPGAC emission control units and determined that they were functional.

⁽⁵⁾ Based on vapor-phase effluent contaminant concentrations, VPGAC within the supplemental VPGAC emissions control units was replaced on March 3, 2021 and again on October 13, 2021. On both occasions, Northrop Grumman inspected the regenerative VPGAC components and identified no malfunctions/issues. Vapor-phase effluent contaminant concentrations will be monitored during upcoming sample rounds.

⁽⁶⁾ Following the collection of the Q1 2022 sample, the system was reconfigured to bypass the regenerative VPGAC components and treat air stripper effluent directly through the exterior VPGAC emission control units. In addition, the exterior VPGAC was changed-out in April 2022.

⁽⁷⁾ Given that other contaminants in this sample generally show an expected decline from influent, to midfluent, to effluent concentrations, it is unclear why the effluent TCE concentration is markedly higher than influent and midfluent TCE concentrations. Following the collection of the Q1 2022 sample, the system was reconfigured to bypass the regenerative VPGAC components and treat air stripper effluent directly through the exterior VPGAC emission control units. A follow-up vapor-phase sample was collected in April 2022, as part of enhanced monthly monitoring activities following system reconfiguration in March 2022, and following change-out of the exterior VPGAC in April 2022. As summarized on Table 3A, this sample exhibited contaminant concentrations more in-line with expectations.

⁽⁸⁾ Note that where the 12-month rolling average was greater than 100%, the Rule 212 compliance limit for TCE was not exceeded. These rolling average values are due to an anomalously elevated effluent concentration associated with the February 16, 2022 sample event.

⁽⁹⁾ During this quarterly reporting period, monthly air samples were collected for laboratory analysis of VOCs as part of an enhanced sampling program implemented to more closely monitor T96 following its reconfiguration to eliminate the regenerative VPGAC components of the system. As a conservative "worst case" scenario, the sample exhibiting the greatest TVOC concentrations in system effluent from the three monthly samples was compared to the Rule 212 compliance limits for this reporting period.

Table 6
Concentrations of Volatile Organic Compounds and 1,4 Dioxane in Monitoring Wells
Second Quarter 2022
Operable Unit 2
Northrop Grumman
Bethpage, New York

Notes and Abbreviations:

- (1) Samples were analyzed for VOCs using USEPA Method 8260C.
Samples were analyzed for 1,4-dioxane using USEPA Method 8270D-SIM.
- (2) Results for the program are validated at 20% frequency, per protocols specified in OU2 Groundwater Monitoring Plan (Arcadis 2016).
- (3) TVOC concentrations are rounded to the number of decimal places of the individual VOC with the least precision (decimal places), including whole numbers with no decimal place.
- (4) GM-79I was initially sampled for VOCs and 1,4-dioxane on April 20, 2022; however, the 1,4-dioxane bottleware was damaged during transit to the laboratory. GM-79I was subsequently resampled on May 4, 2022 for 1,4-dioxane only.

Bold	Constituent detected
J	Constituent value is estimated
REP	Blind Replicate Sample
µg/L	Micrograms per liter
VOCs	Volatile Organic Compounds
<1.0	Compound not detected above its laboratory quantification limit
ND	Not Detected

Table 8
**Concentrations of Volatile Organic Compounds
and 1,4 Dioxane in Outpost Wells⁽¹⁾**
Second Quarter 2022
Operable Unit 2
Northrop Grumman
Bethpage, New York

Notes and Abbreviations:

- (1) These outpost wells have been recently repurposed for use as plume monitoring wells per the June 2015 Groundwater Monitoring Plan Addendum (ARCADIS of New York, Inc., 2015) as conditionally approved by the NYSDEC (August 25, 2015). Therefore, TVOC trigger levels that may have been previously established are no longer shown.
- (2) Samples were analyzed for VOCs using USEPA Method 524.2. Samples were analyzed for 1,4-dioxane using USEPA Method 522.
- (3) Results for the program are validated at 20% frequency, per protocols specified in OU2 Groundwater Monitoring Plan (Arcadis 2016).
- (4) TVOC concentrations are rounded to the number of decimal places of the individual VOC with the least precision (decimal places), including whole numbers with no decimal place.

Bold Value indicates constituent detected

TVOCs Total Volatile Organic Compounds

USEPA United States Environmental Protection Agency

VOC Volatile Organic Compounds

µg/L micrograms per liter

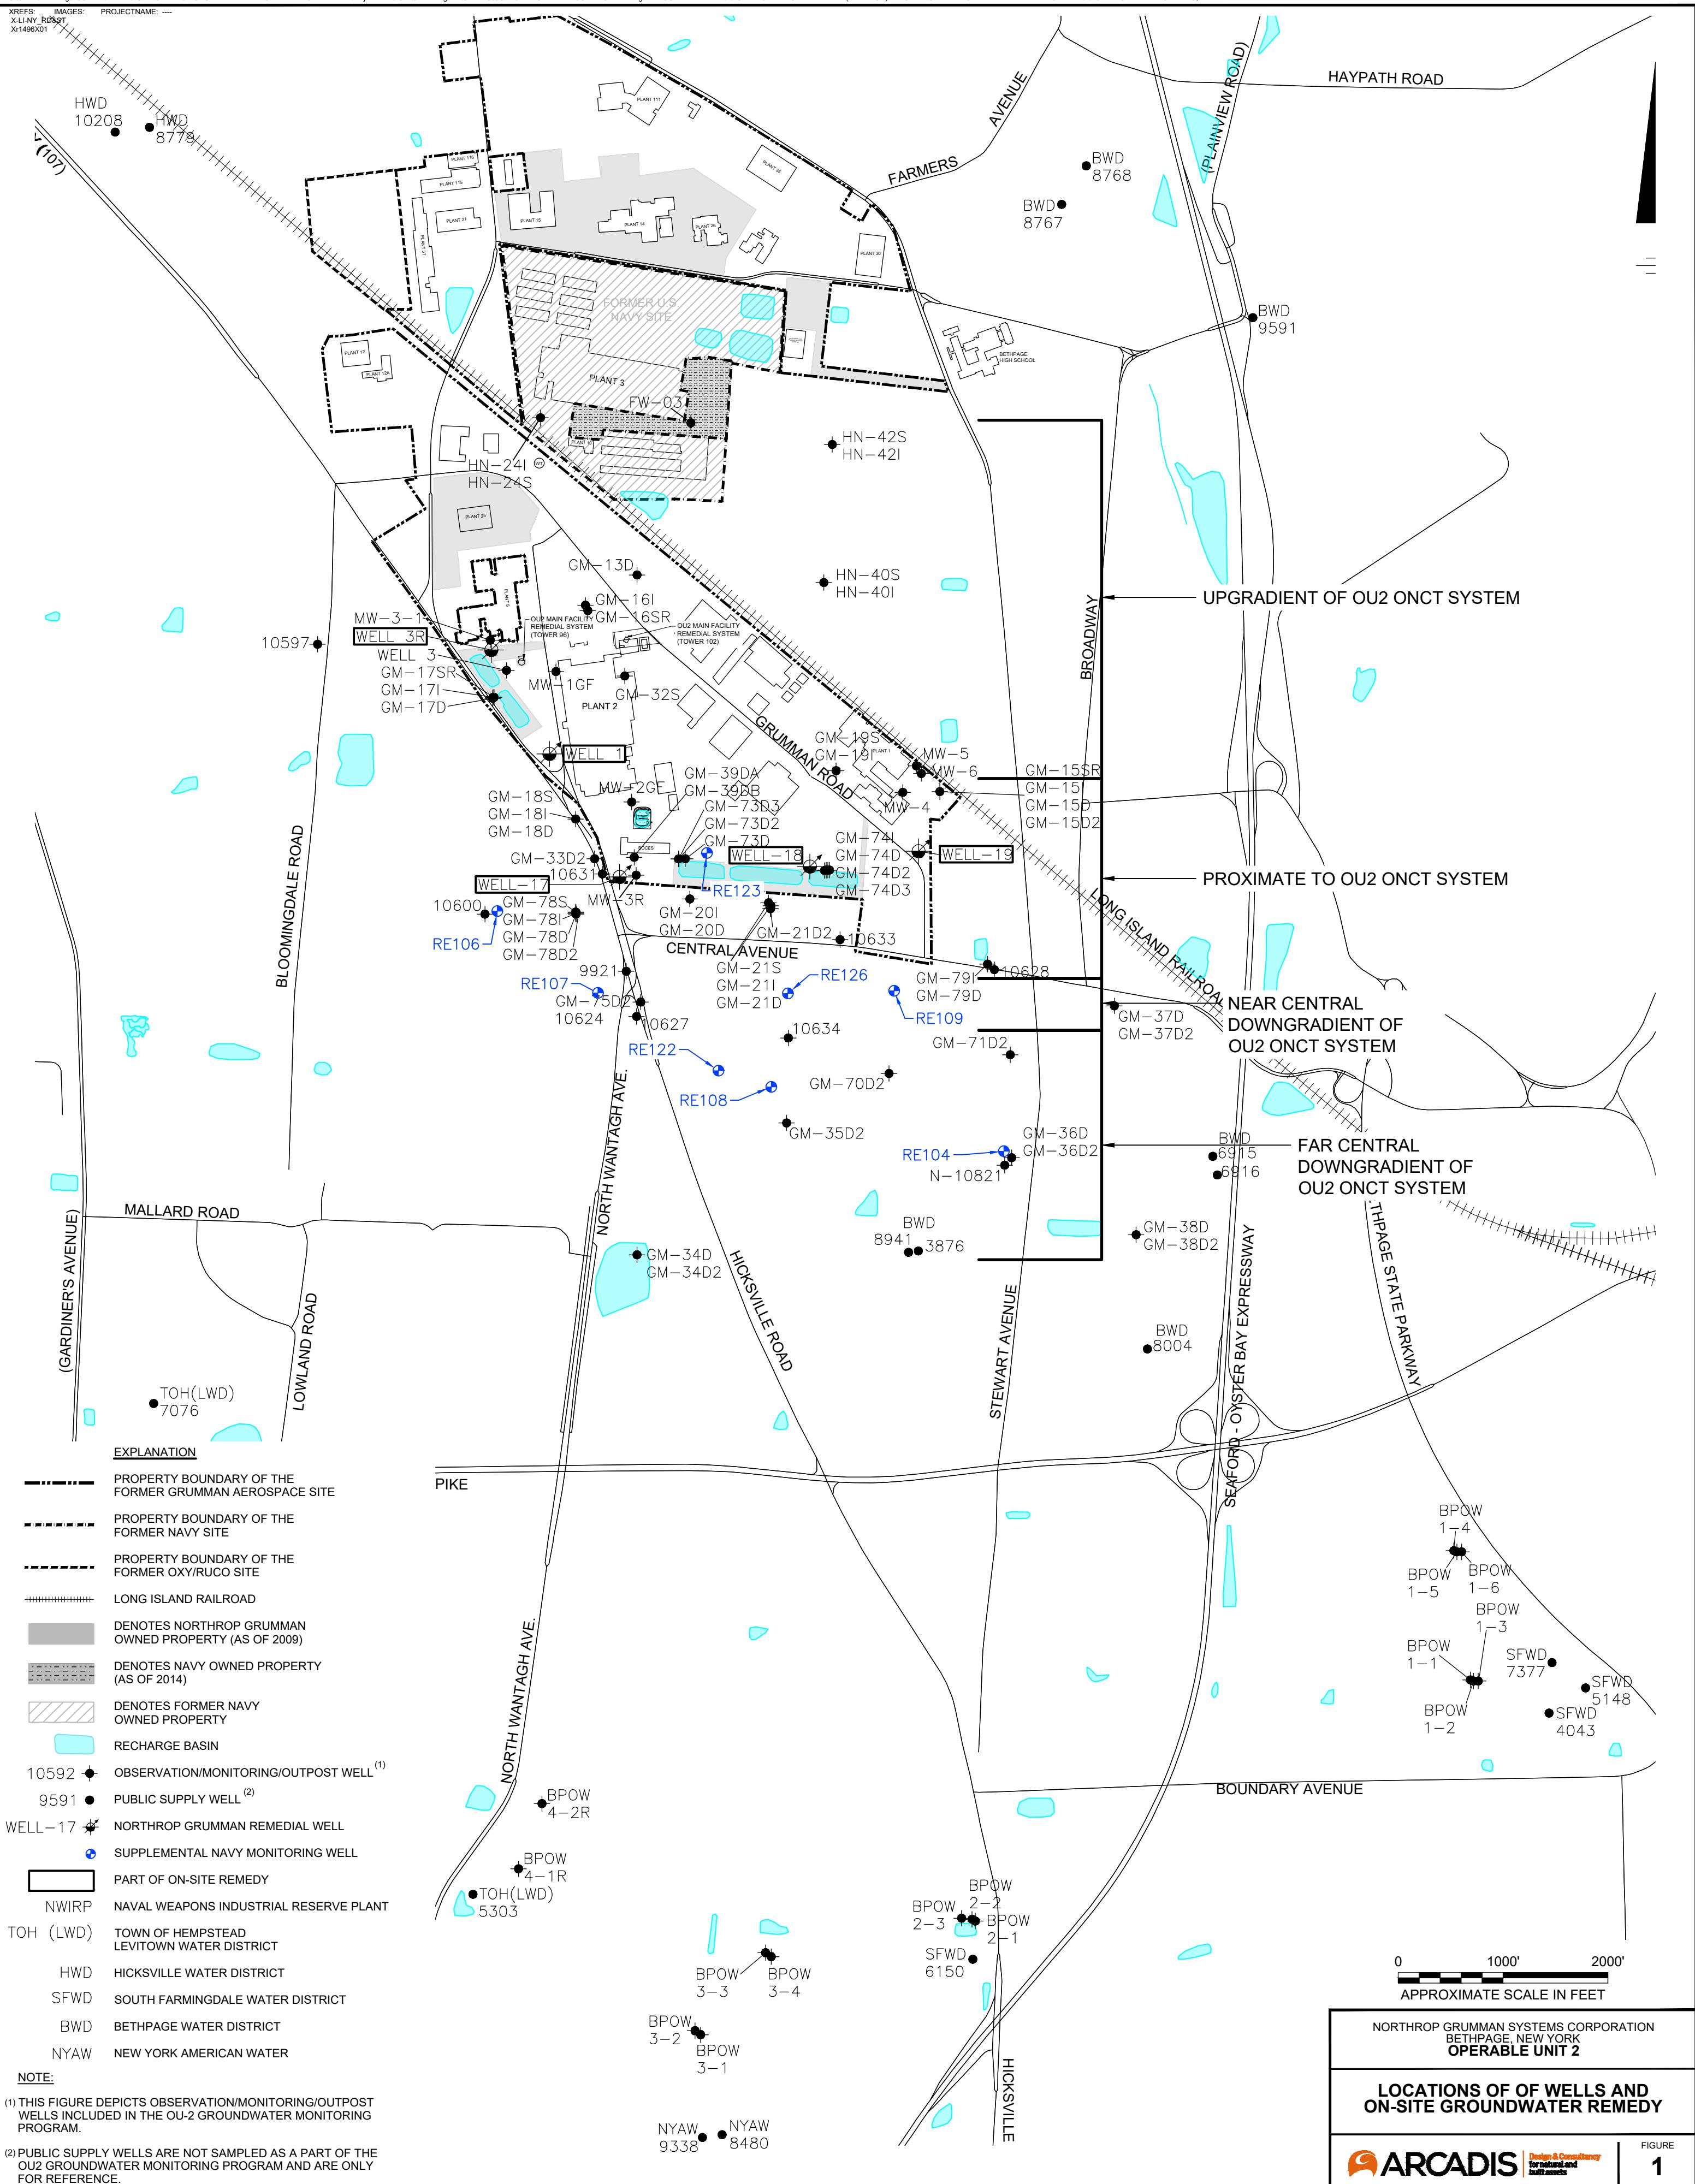

<0.5 Compound not detected above its laboratory quantification limit

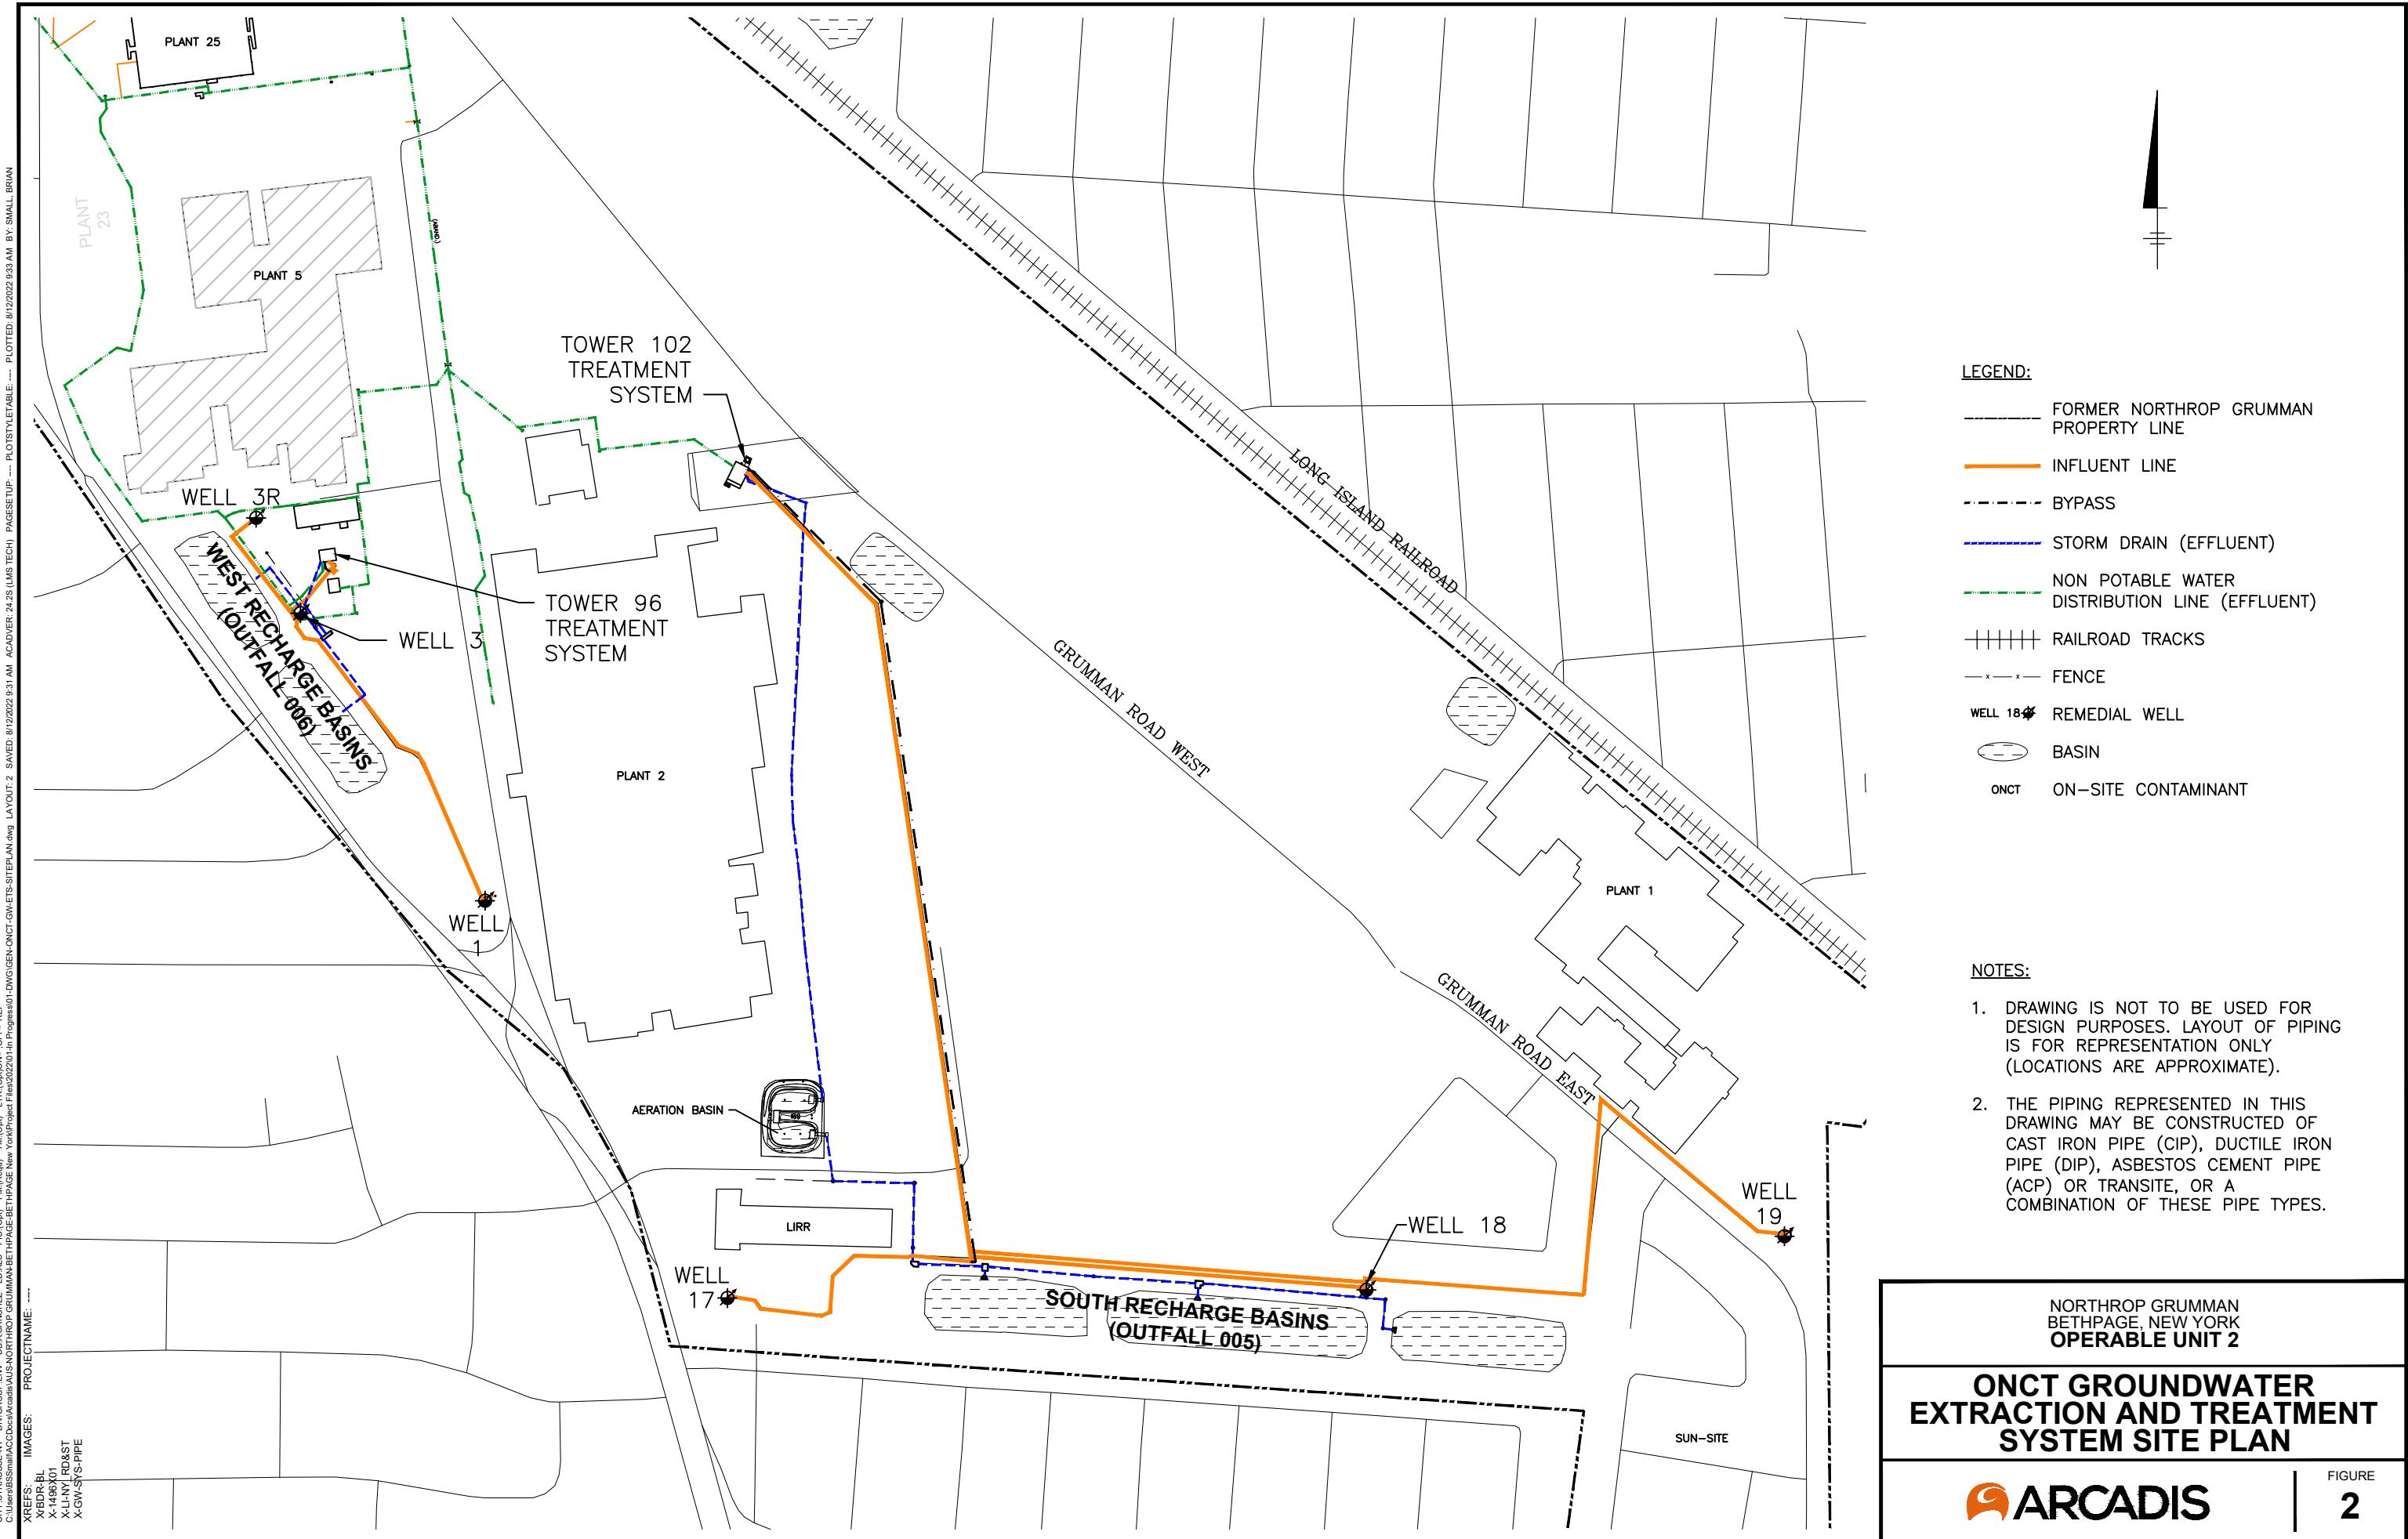

D Result was reported from the diluted run

J Value is estimated concentration

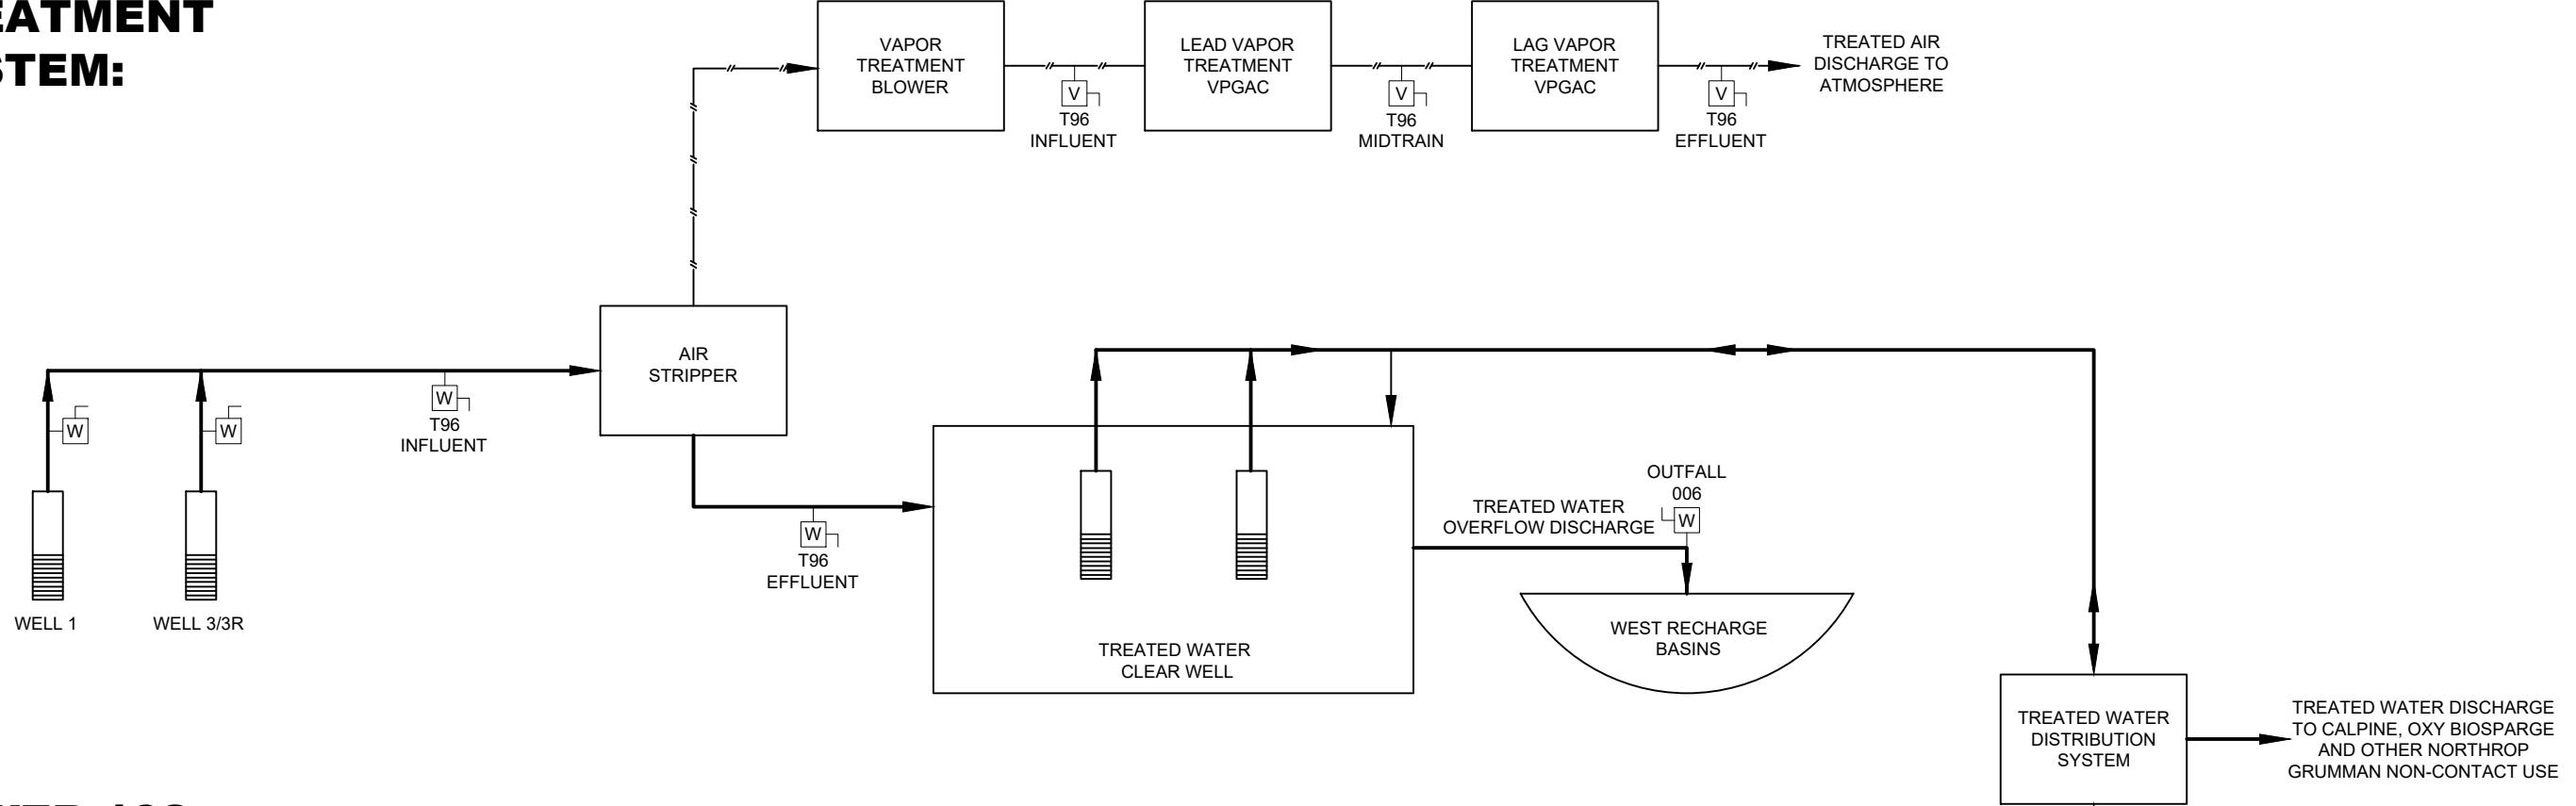

ND Not Detected
