8 January 2024

Mr. Scott Sokolowski
Remedial Project Manager
Naval Facilities Engineering Command, Mid Atlantic
9324 Virginia Avenue, Building Z-144
Norfolk, VA 23511-3095

Subject: **US NAVY CONTRACT NO. N40085-16-D-2288**
CONTRACT TASK ORDER NO. 4042
2023 THIRD QUARTER SVECS OPERATIONS REPORT - SITE 1
NAVAL WEAPONS INDUSTRIAL RESERVE PLANT, BETHPAGE, NY

Dear Mr. Sokolowski:

An electronic copy of the *2023 Third Quarter Operations Report, Soil Vapor Extraction Containment System, Site 1, Former Drum Marshalling Yard, Naval Weapons Industrial Reserve Plant, Bethpage, New York,* has been submitted to your attention.

Please contact me at rgregory@komangs.com or 610.400.0636 if you have any questions or comments regarding this submittal.

Sincerely,
KOMAN Government Solutions, LLC (KGS)

Robert G. Gregory
Project Manager

1.0 INTRODUCTION

KOMAN Government Solutions, LLC (KGS) has prepared this Third Quarter 2023 Operations Report for the Soil Vapor Extraction Containment System (SVECS) at Site 1, Former Drum Marshalling Area, at the Naval Weapons Industrial Reserve Plant (NWIRP) in Bethpage, New York. This report has been prepared for the United States Department of the Navy (Navy), Naval Facilities Engineering Systems Command (NAVFAC), Mid-Atlantic, under Contract No. N40085-16-D-2288, Contract Task Order (CTO) No. N4008517F4042. This Third Quarter 2023 Operations Report details activities that occurred from July 2023 to September 2023. Data were collected and operational activities were performed by KGS in accordance with the following documents:

- *Final Operation & Maintenance Plan for Soil Vapor Extraction Containment System Site 1, Former Drum Marshalling Yard at Naval Weapons Industrial Reserve Plant Bethpage, New York* prepared by Tetra Tech EC, Inc. (TtEC) in 2010, hereafter referred to as the "O&M Manual."

- *Final Supplemental Offsite Soil Vapor Intrusion Monitoring Plan for the Soil Vapor Extraction Containment System, Site 1, Former Drum Marshalling Yard at Naval Weapons Industrial Reserve Plant, Bethpage, New York* prepared by Tetra Tech NUS, Inc. (TtNUS) in 2012.

- *Final Tier II Sampling and Analysis Plan, Operations, Maintenance, and Monitoring of the SVECS, Site 1, Naval Weapons Industrial Reserve Plant, Bethpage, New York* prepared by KGS in January 2023.

1.1 Site Location

NWIRP Bethpage is located in east central Nassau County, Long Island, New York, approximately 30 miles east of New York City. In the late 1990s, the Navy's property totaled approximately 109.5 acres and was formerly a Government Owned Contractor-Operated (GOCO) facility that was operated by Northrop Grumman (NG) until September 1998. NWIRP Bethpage was bordered on the north, west, and south by property owned, or formerly owned, by NG that covered approximately 550 acres, and on the east by a residential neighborhood. The Navy currently retains approximately nine acres of the former NWIRP, including Site 1, which lies within the fenced area of NWIRP Bethpage and is located east of Plant No. 3, west of 11th Street, and north of Plant 17 South (**Figures 1 and 2**).

1.2 Background

NWIRP Bethpage was established in 1943. Since inception, the primary mission of the facility was the research, prototyping, testing, design engineering, fabrication, and primary assembly of military aircraft. Historical operations that resulted in hazardous material generation at the facility included metal finishing processes, maintenance operations, painting of aircraft and components, and other activities that involve aircraft manufacturing. Wastes generated by plant operations were disposed of directly into drainage sumps, dry wells, and/or on the ground surface, resulting in the disposal of a number of hazardous wastes, including volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), and inorganic analytes (chromium and cadmium) at the site. Some of these contaminants have migrated from the source area to surrounding areas, including the soils at these sites and the groundwater beneath and downgradient of the NWIRP Bethpage property. NWIRP

Bethpage is currently listed by the New York State Department of Environmental Conservation (NYSDEC) as an "inactive hazardous waste site" (#1-30-003B).

Soils at Site 1 consist mainly of unconsolidated sediments that overlie crystalline bedrock. A clay unit is present near the groundwater table (50 feet below ground surface [bgs]) at the southeast corner of the site. This clay unit is suspected to be a source of chlorinated solvents that are migrating into the overlying soil gas and the source of off-site VOCs in soil vapor (TtEC, 2010).

Chlorinated solvents including trichloroethene (TCE), tetrachloroethene (PCE), and 1,1,1-trichloroethane (TCA) have been identified as the VOCs of interest in soil gas at the site. Concentrations greater than 1,000 micrograms per cubic meter ($\mu g/m^3$) of soil vapor have been directly associated with Site 1 activities and historical environmental data, and based on preliminary screening, exceed guidelines established by the New York State Department of Health (NYSDOH) for sub-slab soil vapor concentrations at the time as provided in *Guidance for Evaluating Soil Vapor Intrusion in the State of New York* (NYSDOH, 2006). Updates to the evaluation matrices were established in May 2017 (NYSDOH, 2017). The 2017 updates lowered the sub-slab soil vapor screening value for TCE from 250 $\mu g/m^3$ to 60 $\mu g/m^3$; the screening values for PCE and 1,1,1-TCA remained at 1,000 $\mu g/m^3$ (NYSDOH, 2017). Of these compounds, TCE is the primary VOC of concern. Mitigation of TCE contamination in accordance with NYSDOH guidance is expected to remediate other VOCs associated with the site. PCBs, cadmium, and chromium have also been identified in site soils at concentrations requiring remediation. The majority of these chemicals have been detected in the central portion of Site 1 and will be addressed via a separate remediation (TtEC, 2010).

Prior to implementation of the SVECS, the mean concentrations of VOCs in soil gas samples collected along the eastern fence-line were 41,128 $\mu g/m^3$ of TCE, 381 $\mu g/m^3$ of PCE, and 20,634 $\mu g/m^3$ of 1,1,1-TCA. The maximum concentrations of VOCs in the soil gas samples were 180,000 $\mu g/m^3$ of TCE, 1,200 $\mu g/m^3$ of PCE, and 90,000 $\mu g/m^3$ of 1,1,1-TCA (TtEC, 2010).

1.3 Project Overview and Objective

The remedial objective for this project is to use an on-site soil vapor extraction (SVE) system to prevent further off-site migration of VOC-contaminated soil vapor and to the extent practical, capture contaminated soil vapor with a TCE concentration greater than 250 $\mu g/m^3$. A secondary objective of this project is to address soil vapor with a TCE concentration greater than 5 $\mu g/m^3$. The SVECS is an interim action intended to address migration of VOCs in contaminated soil vapors. It is expected to operate continuously 24 hours/day, seven days/week, with the exception of maintenance and adjustment periods, until the remedial objectives are met (TtEC, 2010).

1.4 SVECS Overview

The SVECS consists of soil vapor extraction, soil vapor monitoring, and soil vapor treatment. Twelve SVE wells (SVEWs) are located along the eastern boundary of Site 1 in six clusters, each consisting of one intermediate well and one deep well. Intermediate wells SVE-101I, SVE-102I, SVE-103I, SVE-104I, SVE-105I, and SVE-106I have a screened interval between 25 and 35 feet bgs. Deep wells SVE-101D, SVE-102D, SVE-103D, SVE-104D, SVE-105D, and SVE-106D have a screened interval between 40 and 60 feet bgs. The groundwater table fluctuates between approximately 50 and 55 feet bgs. Each SVEW is

operated at a flow rate such that the combined total flow rate is approximately 300-400 standard cubic feet per minute (scfm) of soil vapor. Each intermediate depth SVEW requires an approximate vacuum of four inches of water column (i.w.) and each deep SVEW requires a vacuum of up to 20 i.w. in order to extract the targeted flow rates. The 12 SVEWs have been piped below the ground to the Flow Monitoring Station (FMS), where flow, vacuum, and vapor quality are monitored. Within the FMS, the discharge lines from the individual SVEWs have been equipped with a 2-inch flow control butterfly valve, a vacuum gauge, and a sampling port. The sampling port is utilized to measure the flow rate from an individual well using a portable velocity meter and to collect vapor samples. All the SVE lines collect into a single manifold within the FMS and from this location a single underground pipeline has been routed approximately 1,400 linear feet to the Treatment Building (Building 03-35). Five additional SVEWs (SVE-107D, SVE-108D, SVE-109D, SVE-110D, and SVE-111D) were installed in October 2011 to address potential VOCs under Plant No. 3 and the South Warehouse. These five wells were connected directly to the pipeline leading to the Treatment Building downstream of the FMS; no sampling ports were established for these wells. During the Second Quarter 2022, six additional SVEWs (SVE-112D, SVE-113D, SVE-114D, SVE-115D, SVE-116D and SVE-117D) were brought online to address residual VOC concentrations in the central area of Site 1. A separate FMS was constructed in 2022 for these six SVEWs that includes sampling ports for each well. Sampling of these additional SVEWs began in September 2022. A site plan depicting all SVEW locations is included as **Figure 3**.

The SVECS is housed within the Treatment Building, an existing and unoccupied building also known as Building 03-35. The treatment system consists of a moisture separator, two SVE blowers, and a 5,000-pound vapor-phase granular activated carbon (VGAC) unit for removal of chlorinated VOCs from the off-gas. Soil vapor that enters the Treatment Building first passes through the moisture separator tank where any condensate is separated. To date, no condensate has formed in this tank. The vapor is then passed through an air filter and SVE blower and then treated in the VGAC unit. The treated vapor is discharged from the VGAC via an exhaust stack. The SVECS has a control panel comprised of mechanical interlocks and relays for local operation. A System Layout Plan is presented in **Figure 4**.

The off-gas from the SVECS is monitored for chlorinated VOCs as identified in the NYSDEC Division of Air Resources (DAR) permit equivalent effluent limitations and updated approval documentation (**Appendix A**) and monitoring requirements (TtEC, 2010). Samples are submitted to a NYSDOH-certified, National Environmental Laboratory Accreditation Conference (NELAC)-certified, and Department of Defense (DoD) Environmental Laboratory Accreditation Program (ELAP)-accredited laboratory, Eurofins Air Toxics, LLC located in Folsom, California, for analysis of VOCs by modified method TO-15. Prior to January 2014, samples were analyzed for target compound list (TCL) VOCs. As of January 2014, upon approval by NYSDEC and NYSDOH, samples are analyzed for site-specific VOCs. The site-specific VOCs are: 1,1,1-TCA, 1,1-dichloroethane (DCA), 1,1-dichloroethene (DCE), 1,2-DCA, cis-1,2-DCE, PCE, trans-1,2-DCE, TCE, and vinyl chloride (VC).

A total of 18 soil vapor pressure monitor (SVPM) / soil gas monitoring points have been installed in the residential neighborhood east of Site 1 at NWIRP Bethpage (**Figure 3**). These off-site monitoring points consist of eight previously existing SVPMs as well as 10 SVPMs installed in September 2012. Soil vapor pressure readings from the SVPMs are collected quarterly and used to evaluate the SVECS vacuum field. In addition, analytical results of vapor samples collected annually from these locations and the soil vapor pressure readings are used to further evaluate the SVECS operation and the potential for vapor intrusion.

2.0 SVECS OPERATION AND MAINTENANCE

While designed to run autonomously, the SVECS requires regular visits by an operator to record and adjust operational parameters and to perform scheduled maintenance. The SVECS is equipped with telemetry that will alert an on-call operator in the event of a plant shutdown.

2.1 Routine Maintenance Activities

Routine maintenance activities at the SVECS were performed during the operator's weekly visits during this reporting period. These activities include general site inspections (of the grounds, buildings, doors, and locks), collection of operational data (vapor flowrates, pressures, vacuums, temperature, and photoionization detector [PID] readings), adjustment of system valves, collection of vapor samples (on a monthly and quarterly basis), collection/disposal of condensate if needed, cleaning of filters, switching of lead/lag blower assignments, and preventive maintenance of system equipment.

2.2 Non-Routine Maintenance / Site Activities

The following non-routine activities / repair activities occurred at the SVECS during the Third Quarter 2023 reporting period:

- On 25 July, flow from the 18 SVEWs was rebalanced to create a total flow of approximately 300 cubic feet per minute (cfm) for the 12 boundary wells and a total flow of approximately 300 cfm for the six interior wells.

- On 18 August, the current/load settings on the blower motors were reset to address intermittent drop-offs caused by minor electrical system load variations.

- On 20 September, the Site 4 SVEW effluent connection to the Site 1 treatment system was activated.

3.0 SVECS MONITORING

Several process vapor samples are collected on a monthly basis to monitor the SVECS operation. These samples consist of an influent sample (as well as a duplicate sample), located immediately prior to the VGAC unit, and an effluent sample, located after the VGAC unit and before the exhaust stack. Vapor samples are also collected from the 18 active SVEWs on a quarterly basis to monitor the capture of the contaminated soil vapor by the SVEWs. In addition, quarterly pressure measurements are collected from the 18 SVEWs and the 18 SVPMs to monitor the SVECS vacuum field, and soil gas sampling from the 18 SVPMs is conducted annually (generally in the winter) to evaluate the effectiveness of the SVECS. The first annual soil gas sampling event was conducted in the winter 2012-2013. The eleventh annual sampling event was conducted in February 2023.

3.1 Monthly Air Quality Monitoring

Analysis of influent and effluent vapor sample locations is performed to evaluate VOC mass removal and the effectiveness of the VGAC adsorption unit. Time-integrated vapor samples are collected using 6-liter summa canisters with 30-minute flow regulators.

Treated off-gas discharged at the exhaust stack is subject to emissions limitations. Initially, discharge goals were derived from calculations submitted by the Navy and accepted by the NYSDEC in the February 2010 DAR permit equivalent application. In September 2011, the Navy submitted an evaluation proposing revised discharge goals (TtNUS, 2011), which NYSDEC concurred with in October 2011. A copy of this documentation is included as **Appendix A**.

Summaries of the monthly treatment system influent and effluent vapor sampling results for July, August, and September (Third Quarter) are presented in **Tables 1, 2, and 3**, respectively. Emission rate calculations for both the influent stream (prior to VGAC treatment) and effluent stream (following VGAC treatment) and the computed monthly mass recoveries are also presented. Emission rates of the influent stream as well as mass recovery are calculated to monitor progress and determine when influent concentrations have reached levels at which vapor treatment via carbon adsorption is no longer required. The data presented in **Tables 1, 2, and 3** demonstrate that all constituents were within the effluent emission rate guidelines (**Appendix A)** during the current reporting period.

All raw analytical data are provided under a separate cover.

3.2 Quarterly Air Quality Monitoring of SVEWs

Time-integrated vapor samples are collected quarterly using 6-liter summa canisters with 30-minute flow regulators at six intermediate and twelve deep SVEWs. The samples are collected for the purpose of tracking and documenting the performance of the SVECS (TtEC, 2010).

Table 4 presents the data collected on 15 August 2023 (Third Quarter 2023) for the active 18 SVEWs.

Analytical results of select VOCs (1,1,1-TCA, PCE, and TCE) detected at the 18 SVEWs active during the Third Quarter are presented on **Figure 5**. Historical analytical results of quarterly vapor samples

collected from December 2009 through the Third Quarter 2023 for the 18 SVEWs are presented in **Table 5**.

3.3 Quarterly Soil Vapor Pressure Monitoring of SVEWs and Off-site SVPMs

Soil vapor pressure readings are collected quarterly from the 18 active SVEWs and 18 SVPMs to monitor the SVECS vacuum field. Soil vapor pressure readings from these locations were collected on 15 August. Results of the Third Quarter vapor pressure monitoring event are presented in **Table 6**.

The vapor pressure readings collected from the SVEWs ranged between -2.0 to -8.0 i.w., indicating that a vacuum has been established along the fence line. The vapor pressure readings collected from the SVPMs ranged between 0.00 to -0.50 i.w.. Two SVPMs (SVPM 2007I and SVPM 2007D) yielded vapor pressure readings of 0.00 i.w. indicating no vacuum was measured at these depth intervals at these locations. However, vacuum was measured in the shallow SVPM at this location. Further investigation of these two SVPMs is required to determine whether these probes have been compromised. SVPM vapor pressure readings indicate that a vacuum has been established in the residential neighborhood. Pressure readings from the 18 SVPMs are presented on **Figure 6**.

3.4 Annual Vapor Quality Monitoring of Off-site SVPMs

Time-integrated vapor samples are collected annually using 6-liter summa canisters with 30-minute flow regulators at 18 SVPM locations. The annual 2023 SVPM samples were collected on 22 February 2023. Analytical results from the SVPM monitoring event were included in the First Quarter 2023 Operations Report submitted in June 2023.

3.5 Soil Vapor Quality Concentration Trends

Historical vapor analytical results for 18 SVEWs (SVE-101I through SVE-106D and SVE-112D through SVE-117D) through the Third Quarter are presented in **Table 5**. In addition, concentration trends of select VOCs for the SVECS combined influent (1,1,1-TCA, PCE, TCE, and total VOCs) and each of the 18 SVEWs (1,1,1-TCA, PCE, and TCE) are presented in **Appendix B**. Concentration trends observed in 18 SVEWs through the Third Quarter 2023 are discussed below.

- Combined Influent: Overall VOC concentrations in the combined influent increased during the Third Quarter 2023 relative to the Second Quarter 2023, with total VOC concentrations of 1,020 µg/m^3 in July (**Table 1**), 965 µg/m^3 in August (**Table 2**), and 1,094 µg/m^3 in September (**Table 3**). TCE, PCE and 1,1,1-TCA concentrations remain approximately one to two orders of magnitude below baseline concentrations measured in December 2009 (42,000 µg/m^3 TCE, 7,900 µg/m^3 PCE, and 13,000 µg/m^3 1,1,1-TCA).

- SVE-101I: Concentrations of two VOCs measured at this location (20 µg/m^3 TCE and 1.5 J µg/m^3 1,1,1-TCA) increased in the Third Quarter 2023 relative to concentrations measured in the Second Quarter 2023 (**Table 5)**. The concentration of PCE decreased from 4.7 J µg/m^3 to 2.9 J µg/m^3. All concentrations are four to five orders of magnitude below baseline concentrations measured in December 2009 (180,000 µg/m^3 TCE, 1,700 µg/m^3 PCE, and 51,000 µg/m^3 1,1,1-TCA).

- SVE-101D: Concentrations measured at this location (1,000 µg/m^3 TCE, 28 µg/m^3 PCE, and 9.1 µg/m^3) increased in the Third Quarter 2023 relative to concentrations measured in the Second Quarter 2023 (**Table 5**). All concentrations are two to four orders of magnitude below baseline concentrations measured in December 2009 (100,000 µg/m^3 TCE, 3,200 µg/m^3 PCE, and 26,000 µg/m^3 1,1,1-TCA).

- SVE-102I: Concentrations measured at this location (14 µg/m^3 TCE, 3.3 J µg/m^3 PCE, and 3.4 J µg/m^3 1,1,1-TCA) increased in the Third Quarter 2023 relative to concentrations measured in the Second Quarter 2023 (**Table 5**). All concentrations are one to two orders of magnitude below the maximum concentrations measured in June 2010 (300 µg/m^3 TCE, 17 µg/m^3 PCE, and 13 µg/m^3 1,1,1-TCA).

- SVE-102D: Concentrations measured at this location (56 µg/m^3 TCE, 15 µg/m^3 PCE, and 3.2 J µg/m^3 1,1,1-TCA) increased in the Third Quarter 2023 relative to concentrations measured in the Second Quarter 2023 (**Table 5**). All concentrations are one to two orders of magnitude below baseline concentrations measured in December 2009 (440 µg/m^3 TCE, 10 µg/m^3 PCE, and 130 µg/m^3 1,1,1-TCA).

- SVE-103I: Concentrations measured at this location (2.9 J µg/m^3 TCE, 4.0 J µg/m^3 PCE, and 0.80 J µg/m^3 1,1,1-TCA) increased in the Third Quarter 2023 relative to concentrations measured in the Second Quarter 2023 (**Table 5**). All concentrations are two orders of magnitude below the baseline concentrations measured in December 2009 (900 µg/m^3 TCE, 580 µg/m^3 PCE, and 900 µg/m^3 1,1,1-TCA).

- SVE-103D: Concentrations of TCE and 1,1,1-TCA measured at this location remained at the non-detect level and PCE (3.6 J µg/m^3) increased slightly in the Third Quarter 2023 relative to concentrations measured in the Second Quarter 2023 (**Table 5**). All concentrations remain three to four orders of magnitude below baseline concentrations measured in December 2009 (3,100 µg/m^3 TCE, 20,000 µg/m^3 PCE, and 3,000 µg/m^3 1,1,1-TCA).

- SVE-104I: Concentrations measured at this location (non-detect TCE, 2.1 J µg/m^3 PCE, and non-detect 1,1,1-TCA) either increased or remained constant in the Third Quarter 2023 relative to concentrations measured in the Second Quarter 2023 (**Table 5**). All concentrations are one to two orders of magnitude below baseline concentrations measured in December 2009 (710 µg/m^3 TCE, 3,100 µg/m^3 PCE, and 730 µg/m^3 1,1,1-TCA).

- SVE-104D: Concentrations of TCE, PCE, and 1,1,1-TCA measured at this location remained at the non-detect level in the Third Quarter (**Table 5**). All concentrations are three to four orders of magnitude below baseline concentrations measured in December 2009 (4,600 µg/m^3 TCE, 20,000 µg/m^3 PCE, and 3,600 µg/m^3 1,1,1-TCA).

- SVE-105I: Concentrations of TCE and 1,1,1-TCA measured at this location remained at the non-detect level and PCE (5.0 µg/m^3) increased in the Third Quarter 2023 relative to concentrations measured in the Second Quarter 2023 (**Table 5**). All concentrations are one to two orders of magnitude below baseline concentrations measured in December 2009 (76 µg/m^3 TCE, 70 µg/m^3 PCE, and 9.9 µg/m^3 1,1,1-TCA).

- SVE-105D: Concentrations of TCE and 1,1,1-TCA measured at this location remained at the non-detect level and PCE (3.1 J µg/m^3) increased slightly in the Third Quarter 2023 relative to concentrations measured in the Second Quarter 2023 (**Table 5**). All concentrations are three to four orders of magnitude below baseline concentrations measured in December 2009 (1,700 µg/m^3 TCE, 2,100 µg/m^3 PCE, and 550 µg/m^3 1,1,1-TCA).

- SVE-106I: Concentrations of TCE and 1,1,1-TCA measured at this location remained at the non-detect level and PCE (1.6 J µg/m^3) increased slightly in the Third Quarter 2023 relative to concentrations measured in the Second Quarter 2023 (**Table 5**). Following a substantial increase in concentrations measured during and immediately after a soil remediation/excavation event in 2020, decreasing trends have been noted after the event and have continued into the Third Quarter 2023. All concentrations are three to four orders of magnitude below baseline concentrations measured in December 2009 (1,900 µg/m^3 TCE, 390 µg/m^3 PCE, and 220 µg/m^3 1,1,1-TCA).

- SVE-106D: Concentrations of TCE and 1,1,1-TCA measured at this location remained at the non-detect level and PCE (3.3 J µg/m^3) increased slightly in the Third Quarter 2023 relative to concentrations measured in the Second Quarter 2023 (**Table 5**). Following a substantial increase in concentrations measured during and immediately after a soil remediation/excavation event in 2020, decreasing trends have been noted after the event and have continued into the Third Quarter 2023. All concentrations are three to four orders of magnitude below baseline concentrations measured in December 2009 (3,400 µg/m^3 TCE, 720 µg/m^3 PCE, and 340 µg/m^3 1,1,1-TCA).

- SVE-112D: Concentrations measured at this location (88 µg/m^3 TCE, 40 µg/m^3 PCE, and 16 µg/m^3 1,1,1-TCA) increased in the Third Quarter 2023 relative to concentrations measured in the Second Quarter 2023 (**Table 5**). All concentrations are either equal to or below baseline concentrations measured in September 2022 (160 µg/m^3 TCE, 160 µg/m^3 PCE, and 16 µg/m^3 1,1,1-TCA) (**Table 5**). Rebalancing of the flow for this interior well appears to have increased the capture of impacted vapors at concentrations similar to those measured previously in 2022 following decreases in early 2023.

- SVE-113D: Concentrations measured at this location (75 µg/m^3 TCE, 80 µg/m^3 PCE, and 13 µg/m^3 1,1,1-TCA) increased in the Third Quarter 2023 relative to concentrations measured in the Second Quarter 2023. The concentration of 1,1,1-TCA remains below the baseline concentration measured in September 2022 (24 µg/m^3) while the concentrations of PCE and TCE are above baseline concentrations and are the highest measured concentrations to date (**Table 5**). Rebalancing of the flow for this interior well appears to have increased the capture of impacted vapors at concentrations similar to those measured previously in 2022 following decreases in early 2023.

- SVE-114D: Concentrations measured at this location (3,100 µg/m^3 TCE, 310 µg/m^3 PCE, and 1,200 µg/m^3 1,1,1-TCA) increased in the Third Quarter 2023 relative to concentrations measured in the Second Quarter 2023. The concentrations of TCE and PCE are below baseline concentrations measured in September 2022 (3,900 µg/m^3 and 1,400 µg/m^3, respectively) while the concentration of 1,1,1-TCA is consistent with the highest concentration measured to date in October 2022 (1,200 µg/m^3) (**Table 5**). Rebalancing of the flow for this interior well appears to

have increased the capture of impacted vapors at concentrations measured previously in 2022 following intermittent decreases in early 2023.

- SVE-115D: Concentrations measured at this location (110 µg/m^3 TCE, 120 µg/m^3 PCE, and 22 µg/m^3 1,1,1-TCA) increased in the Third Quarter 2023 relative to concentrations measured in the Second Quarter 2023. Concentrations of TCE and PCE are below baseline concentrations measured in September 2022 (200 µg/m^3 and 190 µg/m^3, respectively) while the concentration of 1,1,1-TCA is slighting above the baseline concentration of 21 µg/m^3 and is the highest concentration measured to date (**Table 5**). Rebalancing of the flow for this interior well appears to have increased the capture of impacted vapors at concentrations similar to those measured previously in 2022 following decreases in early 2023.

- SVE-116D: Concentrations of two VOCs measured at this location (360 µg/m^3 TCE and 360 µg/m^3 1,1,1-TCA) decreased in the Third Quarter 2023 relative to concentrations measured in the Second Quarter 2023, while concentration of PCE slightly increased in the Third Quarter 2023 (3,500 µg/m^3). All concentrations are below the baseline concentrations measured in September 2022 (700 µg/m^3 TCE, 7,800 µg/m^3 PCE, and 510 µg/m^3 1,1,1-TCA) (**Table 5**).

- SVE-117D: Concentrations of two VOCs measured at this location (210 µg/m^3 TCE and 43 µg/m^3 PCE) increased in the Third Quarter 2023 relative to concentrations measured in the Second Quarter 2023, while concentration of 1,1,1-TCA decreased in the Third Quarter 2023 (4.5 µg/m^3). The concentrations of PCE and 1,1,1-TCA are below baseline concentrations measured in September 2022 (86 µg/m^3 and 8.1 µg/m^3, respectively). The concentration of TCE is above the baseline concentration but less than the maximum concentration (650 µg/m^3) measured in February 2023 (**Table 5**).

4.0 CONCLUSIONS AND RECOMMENDATIONS

As stated in Section 1.3, the objectives of the Site 1 SVECS are to prevent further off-site migration of VOC contaminated soil vapor and to the extent practical, capture soil vapor with elevated TCE concentrations. Based on the presence of a vacuum field and the maintenance of VOC concentrations at less than the screening values in the off-property area as indicated in the 2023 First Quarter Operations Report, the SVECS is functioning as intended. Influent vapor analytical data with concentrations of TCE above the project action level (greater than 250 $\mu g/m^3$) indicate that the SVECS should continue to be operated on a full-time basis to achieve continued capture of contaminated soil vapor. Monthly monitoring of the combined influent and effluent as well as quarterly monitoring of individual SVEWs should continue. Quarterly and annual monitoring of the SVPMs should also continue in order to ensure that a measurable vacuum field is being established and that the area is being effectively treated. Periodic system adjustments should be performed to focus on areas of elevated VOCs in soil vapor while maintaining a consistent vacuum field in the off-property area. SVPM 2007I and SVPM 2007D should be evaluated to determine if they are functioning properly.

Trichloroethene	20	1000	14	56	2.9 J	ND	ND	ND	ND	ND	ND	ND	88	75	3100	110	360	210
Vinyl Chloride	ND	ND	ND	ND	ND	ND	ND	ND	ND	ND	ND	ND	ND	ND	ND	ND	ND	ND

Notes:

All samples were analyzed for site-specific VOCs by modified method TO-15.

µg/m^3 = micrograms per cubic meter

ND = Not detected above method detection limit

NYSDEC AIR DISCHARGE LIMIT DOCUMENTATION

From: Steven Scharf [mailto:sxscharf@gw.dec.state.ny.us]
Sent: Thursday, October 06, 2011 11:57 AM
To: Fly, Lora B CIV NAVFAC MIDLANT, IPTNE
Cc: John Swartwout; Walter Parish; Steven Karpinski; John cofman; klumpe@steelequities.com; David.Brayack@ttnus.com
Subject: NWIRP Plant 3 Site 1 SVE Modification Plan

Lora,

The New York State Department of Environmental Conservation (NYSDEC), in conjunction with the New York State Department of Health (NYSDOH), have reviewed the Navy Submittal entitled:

" Modification to existing Soil vapor Extraction (SVE) Containment System At Site 1-Former Drum Marshaling Area, Installation of Soil Vapor Extraction Wells SVE-107D to 111D, NWIRP Bethpage, September 2011."

Based on this Departmental review, and the follow up October 6, 2011 tele-conference,.this modification work plan is acceptable and can be used for immediate implementation. The NWIRP Site 1 SVE system has redundant blowers and overcapacity, even with the additional SVE wells being added. should the Navy and the new property owner, Steel Equities Inc., for the former Plant 3 complex come to agreement to add SVE piping from the former Plant 3, this would be acceptable. Appropriate plans, consistent with the covenants and restrictions to the deed, should be submitted accordingly.

A letter will not follow this e-mail. If you have any questions, please contact me directly.

4.0 PROPOSED REVISIONS TO VAPOR DISCHARGE GOALS

To determine the continued need for off gas treatment, the quality of the influent vapor stream was initially estimated based on soil gas results and compared to discharge goals. Vapor phase treatment was initially installed for the system based on projected relatively high concentrations of several chemicals including 1,1,1-trichloroethane (TCA), trichloroethene (TCE), and tetrachloroethene (PCE). Since the December 2009 startup, VOC concentrations in the extracted vapors have decreased by approximately 98.3 percent and it is uncertain as to whether vapor phase treatment is still required. Presented below are the December 2009 and March 2011 influent (untreated) VOC concentrations and loadings and current discharge goals.

Parameter	December 2009 Influent VOCs		March 2011 Influent VOCs ($\mu g/m^3$)		Current Discharge Goal (pound/hour)[3]
	Concentration ($\mu g/m^3$)[1]	Loading (pound/ hour)[1]	Concentration ($\mu g/m^3$)	Loading (pound/ hour)[2]	
TCA	13,000	0.074	150	0.00023	0.13
TCE	42,000	0.26	460	0.00069	0.07
PCE	7,900	0.029	440	0.00066	0.0009

(1) Initial VOC Loading Rates are from baseline data taken in December 2009. The flow meter was not yet installed when this data was taken, so a value of 385 CFM (flow rate in January 2010) was used to estimate system loading.
(2) Calculated using a flow rate of 400 CFM.
(3) Current discharge goals were based on calculated VOC concentrations using soil gas data from the fence line investigation, a flow rate of 600 CFM, and an assumed treatment efficiency for each VOC of 80 to 90 percent. Based on this evaluation, the existing treatment is no longer required to meet discharge goals.

A DAR-1 Model Analysis was then conducted using the August 2010 influent vapor concentrations of TCA, TCE, and PCE at a flow rate of 500 CFM. The calculated results were then used to back calculate proposed discharge goals based on an allowance of 100% of the annual guideline concentrations (see Appendix E). The following table provides a summary of the proposed discharge goals.

Parameter	August 2010 Influent VOCs (370 CFM – Actual)		Percent AGC Using August 2010 Data	Proposed Discharge Goals	
	Concentration ($\mu g/m^3$)	Loading (pounds/ hour)		Concentration at 500 CFM ($\mu g/m^3$)	Loading (pounds/ hour)
TCA	868	0.0009	0.0004	None[1]	225
TCE	4,170	0.0039	19.4	11,000	0.02
PCE	5,780	0.0057	14.2	22,000	0.04

(1) Greater than 100,000 $\mu g/m^3$.

RE: Naval Weapons Industrial Research Plant(NWIRP)
Site-Bethpage, NYSDEC No. 1-30-003B.

Dear Ms. Fly:

Tetra Tech FW, on behalf of the Department of the Navy (Navy), has submitted the enclosed New York State Department of Environmental Conservation (NYSDEC) Division of Air Resources (DAR) Air Permit Application as a permit equivalent. This DAR Air permit equivalent is for the soil vapor extraction system at Site 1 of Plant 3 of the former Naval Weapons Industrial Reserve Plant (NWIRP) site in Bethpage, NY. The NYSDEC Division of Environmental Remediation (DER) has reviewed the permit equivalent and, by means of this letter approves the Site 1 remedy air discharge for immediate operation.

The NWIRP Site 1 SVE system utilizes the reasonably available control technology (RACT) with activated carbon. The air discharge will be periodically monitored at start up and will be added for routine monitoring in the operation, maintenance and monitoring (OMM) plan, to be submitted shortly for Departmental review.

If you have any questions, please contact me at your earliest convenience at (518)402-9620.

Sincerely,

Steven M. Scharf, P.E.
Project Engineer

Facility Description ☐ Continuation Sheet(s)

Soil vapor remediation by SVE followed by vapor phase GAC

Compliance Statements (Title V Only) N/A

I certify that as of the date of this application the facility is in compliance with all applicable requirements: ☐ YES ☐ NO

If one or more emission units at the facility are not in compliance with all applicable requirements at the time of signing this application (the 'NO' box must be checked), the noncomplying units must be identified in the "Compliance Plan" block on page 8 of this form along with the compliance plan information required. For all emission units at this facility that are operating in compliance with all applicable requirements complete the following:

- ☐ This facility will continue to be operated and maintained in such a manner as to assure compliance for the duration of the permit, except those units referenced in the compliance plan portion of Section IV of this application.
- ☐ For all emission units, subject to any applicable requirements that will become effective during the term of the permit, this facility will meet all such requirements on a timely basis.
- ☐ Compliance certification reports will be submitted at least once a year. Each report will certify compliance status with respect to each requirement, and the method used to determine the status.

EMISSION UNIT 1-00EU1 PROCESS SVE

Description

The Soil Vapor Extraction System will consist of 12 SVE wells (6 intermediate and 6 deep), a moisture separator, and 2 soil vapor extraction blowers (BL-1 and BL-2) which both vent to a vapor phase granular activated carbon unit for treatment prior to discharge from stack 00STA. The VGAC unit will be a 5,000 pound unit, filled with Tetrasolv Virgin Carbon. The VGAC unit has been designed to operate nominally at 600 cfm, with a maximum of 1,000 cfm.
