1.0 INTRODUCTION

This report presents the results of the Post Closure Groundwater Monitoring Program conducted during the fourth quarter 2003 for the Sonia Road Landfill. The sampling program was conducted for the Town of Islip and administered by the Islip Resource Recovery Agency (IRRA) in conformance with the Sampling and Analysis Plan (SAP) prepared by Dvirka and Bartilucci Consulting Engineers (D&B), dated December 2001. The Sampling and Analysis Plan is part of the Sonia Road Post Closure Monitoring and Maintenance Plan (Volume 3 of 4).

1.1 Purpose

The purpose of the Post Closure Groundwater Monitoring Program is to monitor groundwater quality and flow direction following capping and closure of the Sonia Road Landfill.

This Post Closure Groundwater Monitoring Program Report includes discussions of the sample locations, sampling procedures, laboratory analyses, field and analytical results, data validation, groundwater level measurements and flow direction. In addition, this report includes a comparison of the analytical results of this sampling event (November 2003) to applicable New York State groundwater quality standards and guidance values, and groundwater sample results obtained during the previous sampling event (Third Quarter 2003).

1.2 Site Location and Description

The Sonia Road Landfill is a capped and closed inactive municipal solid waste landfill owned by the Town of Islip. The landfill is located at 1355 Howells Road in the hamlet of Brentwood in the western portion of the Town and is in close proximity to the western town boundary between the Towns of Islip and Babylon. The location of the Sonia Road Landfill is shown on Figure 1-1.

The landfill property is 42.2 acres in area and is approximately rectangular in shape. The landfill is bounded to the north by industrial properties, to the east by residential properties, to the south by Deer Park Street with residential properties beyond, and to the west by Howell's Road, Secatogue Road and Corbin Avenue with industrial properties beyond. In the southwest corner of the property is one residential parcel (Tax Map No. 221-2-1), which is not part of landfill property described above. At the northwest corner of the property is a 0.5-acre parcel owned by the Town of Islip (Tax Map No. 198-5-7.3), which is identified as a paper street. Given that the waste mass extends onto this parcel, it is considered as part of the landfill property, and as a result, the overall landfill property is considered to be 42.7 acres. At and abutting the northeast corner of the landfill property is the western extension of Sonia Road for which the facility is named.

The landfill property itself is zoned Industrial I and Industrial II with a small portion along the southeastern boundary zoned as residential.

To the southwest of the landfill property is the West Brentwood Middle School, which is located on the west side of Howell's Road. Beyond the school property to the south and west is the headwaters of Sampawams Creek. Sampawams Creek is fed by groundwater discharge as well as storm water management systems for the surrounding areas. Sampawams Creek runs from north to south and empties into the Guggenheim Lakes, which are located north of the Southern State Parkway. Sampawams Creek generally describes the western boundary of the Town of Islip and the eastern boundary of the Town of Babylon.

The Sonia Road Landfill has been owned by the Town of Islip since 1965. Prior to 1965, the site was privately owned and used as a source of mined sand and gravel. As a result of this mining operation, virtually all of the site was disturbed, including the removal of vegetation, topsoil and underlying minerals. The mining operation was extensive with the removal of minerals progressing to and below the water table. Removal of minerals below the water table was accomplished through the use of dredging equipment. This activity resulted in the formation of a groundwater lake over a significant portion of the site (40% to 50%). It is reported that dredging may have removed materials to a depth approaching 50 feet below the water table. Soil

borings constructed as part of the remedial investigation confirmed that waste lies at least 36 feet below the water table.

In 1965, the Town of Islip took title to the Sonia Road property and began a landfilling operation for the disposal of municipal solid waste. Landfilling of the site occurred between 1965 and 1977. The most active period of landfilling occurred between 1965 and 1974. It has been estimated that between 1.5 and 2.0 million cubic yards of waste was disposed of at the site. There are no weigh records to substantiate this estimate.

The landfill reportedly accepted all municipal solid waste delivered to the site. This waste is reported to have included wood, concrete, metal, plastic, glass, household waste in the form of refuse, rubbish, demolition materials and yard wastes (particularly leaves). It is also reported that junk automobiles were routinely disposed of at the facility and that underground fires were common.

The Sonia Road Landfill was capped in the Fall of 2000. The landfill capping system covers an area of approximately 40 acres. The capping system includes an active landfill gas management system, an on-site storm water management system and a perimeter road constructed around the entire site with recycled concrete aggregate. The storm water management system consists of a series of drainage swales, catch basins, buried storm water piping, dry wells and two recharge basins. Storm water associated with the northeast corner of the property is discharged to a series of dry wells (leaching rings) in the area of Sonia Road. The remainder of the site storm water is directed to Recharge Basins 1 and 2 located on the west side of the property. Recharge Basin 1 is located adjacent to the main entrance gate located on Corbin Avenue and Recharge Basin 2 is located in the southwest corner of the property. For the majority of the site, drainage swales are located on the in-board side of the perimeter road.

2.0 MONITORING WELL NETWORK AND GROUNDWATER SAMPLE LOCATIONS

The monitoring well network for the Sonia Road Landfill consists of 36 wells. Well locations are shown on Figure 2-1. The monitoring wells were constructed in 12 well clusters, with each cluster comprising a shallow (S) well, intermediate (I) well and deep (D) well. All 36 wells were utilized for water level measurements. Well construction information for all wells is summarized in Table 2-1.

Twenty-three (23) wells are included as part of the Post Closure Monitoring Program. The sampled wells are listed in Table 2-2.

Twenty-two (22) of the 23 monitoring wells were sampled as part of the fourth quarter 2003 Post Closure Groundwater Sampling event. Monitoring well MW-02S could not be sampled due to a well casing obstruction at approximately 23 feet below ground surface.

3.0 SAMPLING AND ANALYTICAL PROCEDURES

Sampling procedures for the Sonia Road Landfill site are described in the Sampling and Analysis Plan (SAP). Dedicated and disposable sampling equipment was used whenever possible in accordance with the SAP. All nondisposable equipment was decontaminated before first use on-site and between uses in accordance with the procedures described in the SAP. The following sections provide brief discussions of the procedures used during groundwater level measurements, organic vapor and combustible gas monitoring, groundwater sampling and sample analysis.

3.1 Groundwater Level Measurement

Prior to collecting the groundwater samples, synoptic water level measurements were obtained from all 36 monitoring wells for determination of groundwater elevations and groundwater flow direction. Groundwater level measurements were obtained from a survey measuring point on each well using an electronic water level indicator to an accuracy of 0.01 foot. A discussion of the groundwater level measurement results and groundwater flow direction is provided in Section 6.0.

3.2 Groundwater Sampling

Prior to collection of each groundwater sample, a minimum of 3 to 5 well volumes was purged from the well. Well purging was accomplished by first measuring the static water level in the well and calculating the standing water volume. A decontaminated submersible pump was used to purge each well.

During the purging process, field parameters (pH, specific conductance, temperature, Eh, dissolved oxygen and turbidity) were monitored and recorded. When the values of the field parameters, except turbidity, equilibrated within 10% based on the last two readings, the turbidity of the groundwater was less than 50 Nephelometric Turbidity Units (NTUs) and at least three well volumes had been removed, well purging was considered complete.

Groundwater samples were collected using new, dedicated, disposable polyethylene bailers and polypropylene rope. Samples were collected immediately after purging. Filled sample bottles were stored in ice-filled coolers with the chain of custody forms and delivered on the day of collection to H2M Laboratories, Inc. for analysis. H2M Laboratories, Inc. is approved by the New York State Department of Health under the Environmental Laboratory Approved Program (ELAP) for the analyses performed.

Appropriate quality assurance/quality control (QA/QC) samples, which included field blanks, matrix spike and matrix spike duplicate (MS/MSD) sets and blind duplicates, were collected in accordance with the SAP.

Purge water from all on-site wells and all wells immediately adjacent to the landfill property was disposed directly into the nearest landfill capping system drainage swale. Purge water generated from off-site well clusters 11 and 12 was pumped into a 3,000-gallon tank truck, transported to the landfill and discharged into the landfill's on-site Recharge Basin 1 in accordance with the SAP.

Analytical results are summarized in Appendix A and discussed in Section 4.2. Field forms for the fourth quarter 2003 sampling event, including field observation logs and daily equipment calibration logs, are contained in Appendices B-1 and B-2, respectively, and the chain of custody forms are provided in Appendix C.

3.3 Organic Vapor and Combustible Gas Monitoring

Total organic vapor and combustible gas measurements were collected in all 36 monitoring wells. Organic vapors were measured using a flame ionization detector (FID). Combustible gas was measured using a portable multi-gas meter. Gas monitoring results represent headspace measurements collected during the synoptic groundwater level measurements. The results of the organic vapor and combustible gas monitoring are provided in Section 4.3.

3.4 Analytical Parameters

Groundwater samples collected during the fourth quarter 2003 sampling event were analyzed for NYCRR Part 360 Routine parameters, including leachate indicators and inorganics. The leachate indicators that were analyzed included: alkalinity, ammonia, biochemical oxygen demand, bromide, chemical oxygen demand, chloride, total hardness (as $CaCO_3$), nitrate, total phenols, sulfate, total organic carbon, total dissolved solids and total kjeldahl nitrogen. Samples were analyzed in accordance with SW-846 Methods as specified in the NYCRR Part 360 regulations. The analytical results are discussed in Section 4.2.

Section 4

4.0 ANALYTICAL RESULTS

4.1 Field Parameters

Table 4-1 provides a summary of the final field parameter values and field data measured for the fourth quarter 2003 sampling event.

4.2 Groundwater Samples

The fourth quarter 2003 analytical results for the groundwater samples, compared to NYSDEC Class GA groundwater standards and guidance values, and to previous sample results, are provided in Appendices A-1 (leachate indicator parameters) and A-2 (inorganic parameters). Appendix A-3 contains historic volatile organic compound (VOC) sample results. Appendix A-4 contains historic trend graphs for alkalinity, iron plus manganese, total dissolved solids and specific conductivity from selected upgradient and downgradient wells.

4.2.1 Leachate Indicators

The results of the leachate indicators for the groundwater samples are presented in Appendix A-1. As shown in the results table in Appendix A-1, 13 of the 22 wells sampled exhibited one or more leachate indicators at concentrations exceeding the Class GA groundwater standards and guidance values, including ammonia, bromide, nitrate and sulfate. The leachate indicators that exceeded the Class GA standards/guidance values are discussed below.

Ammonia

The groundwater standard for ammonia (2 milligrams per liter [mg/l]) was exceeded in seven (7) wells (MW-03S, MW-04S, MW-04I, MW-04D, MW-05S, MW-05I and MW-06S). Ammonia concentrations in these wells ranged from 2.88 mg/l in well MW-03S to 9.09 mg/l well MW-05S.

These parameters were selected as possible indicators of landfill impacts to groundwater. These graphs are included in Appendix A-4.

4.3 Organic vapor and Combustible Gas Monitoring

The results of the organic vapor and combustible gas monitoring are presented in Table 4-1. The results measured by the flame ionization detector (FID) show nondetectable readings in all wells, except wells MW-02S, MW-02I and MW-04S. The FID results for these wells are greater than 1,000 parts per million (ppm). Combustible gas readings for wells MW-02S, MW-02I and MW-04S are 48%, 61% and 12%, respectively. The remaining wells showed combustible gas readings of 0% of the lower explosive limit (LEL). The LEL for methane is 5% by volume or 50,000 ppm.

5.0 DATA VALIDATION

Twenty-two (22) groundwater samples were collected in November 2003, as part of the Post Closure Groundwater Monitoring Program sampling event at the Sonia Road Landfill. The samples were analyzed for Routine Parameters as listed in 6 NYCRR Part 360. Sample analysis was performed by H2M Laboratories, Inc., a contractor to the IRRA, in accordance with SW-846 methods as specified in the Part 360 regulations. H2M Laboratories is approved under the New York State Department of Health Environmental Laboratory Approval Program (ELAP) for the analyses performed.

The data package submitted by H2M Laboratories was reviewed for completeness and compliance with the analytical methods. All of the quality assurance/quality control (QA/QC) samples (calibrations, spikes, duplicates and blanks), as well as 20% of the analytical results, were reviewed yielding a "20% validation" in conformance with the Sampling and Analysis Plan. The samples that were reviewed for calculation and transcription errors were MW-02I, MW-03S, MW-04D, MW-11S and MW-12I. The findings of the review process are summarized below.

All samples were analyzed within the method specified holding times. All QA/AC requirements (calibrations, spikes, duplicates and blanks) were met.

Blind duplicate samples Blind Duplicate No. 1 and Blind Duplicate No. 2 were collected from MW-04D and MW-03S, respectively. The results were comparable between the samples and the duplicates. These samples were also specified as the matrix spike (MS) and matrix spike duplicate (MSD) samples. All MS/MSD recoveries were within QC limits.

The metals portion of sample MW-07I required reanalysis due to instrumental interferences. The results from the reanalysis have been included on the data summary tables.

No problems were found with the data package. All results are deemed valid and usable for environmental assessment purposes.

Completed data validation forms for the fourth quarter 2003 sampling event are provided in Appendix D.

6.0 GROUNDWATER LEVEL MEASUREMENTS AND FLOW DIRECTION

Groundwater level measurements were obtained on November 10, 2003, from each of the 23 monitoring wells included in the Post Closure Groundwater Monitoring Program and the 13 additional wells not sampled as part of this program. The depth to water measurements, measuring point elevations and calculated groundwater elevations for the 36 monitoring wells are presented in Table 6-1.

Water level data from November 10, 2003, were used to construct groundwater elevation contour maps for the shallow (water table), intermediate and deep upper glacial aquifer wells at and in the immediate vicinity of the Sonia Road Landfill. Water table and potentiometric surface (for the intermediate and deep wells) elevation contour maps are presented on Figures 6-1, 6-2 and 6-3, respectively. Groundwater flow within the zones screened by the shallow, intermediate and deep wells is predominately toward the southeast in the vicinity of the landfill. These maps are consistent with the maps previously prepared for the site.

7.0 CONCLUSIONS AND RECOMMENDATIONS

7.1 Conclusions

Groundwater Flow

Based on groundwater level measurements collected during the fourth quarter 2003 and the shallow (water table), intermediate and deep potentiometric surface elevation contour maps constructed for the site, groundwater flow at and in the vicinity of the Sonia Road Landfill is predominantly toward the southeast. This groundwater flow direction is consistent with previous maps prepared for the site.

Groundwater Quality

Based on a comparison of the fourth quarter 2003 results to the third quarter 2003 results and review of the historical graphs in Appendix A-4, groundwater quality in the vicinity of the Sonia Road Landfill has not changed substantially.

The detected concentrations of bromide, iron, manganese and sodium are likely not indicative of landfill-influenced groundwater, since concentrations of these parameters above groundwater standards and guidance values were detected in both upgradient and downgradient wells.

7.2 Recommendations

Based on the fourth quarter 2003 results and comparison of these results to historical data for the Sonia Road Landfill, it is recommended to continue to sample the groundwater monitoring wells in accordance with the SAP.

V. Duplicate Analysis

1. Was a duplicate prepared and analyzed at the contract specified frequency?

   Yes

   Comments:

2. Were control limits for the relative percent differences (RPD) met for each analyte?

   Yes

   Comments:

No problems found

For sample values >5 times the CRDL, the RPD control limit is ±20%.

For sample values >5 times the CRDL, the RPD control limit is ±CRDL.

If sample results were outside of the control limits, all data associated with that duplicate sample should have been flagged with a "*".

   Yes

   Comments:

2. Were the matrix spike recoveries within the contract specified control limits (75-125%)?

   Yes

   If "No", note analytes _____

   Data should have been flagged with "N" for analytes out of control limits. If the sample concentration exceeds the spike concentration by a factor of four or more, no flag is required.
