1.0 INTRODUCTION

This report presents the results of the Post Closure Groundwater Monitoring Program conducted during the second quarter 2004 for the Sonia Road Landfill. The sampling program was conducted for the Town of Islip and administered by the Islip Resource Recovery Agency (IRRA) in conformance with the Sampling and Analysis Plan (SAP) prepared by Dvirka and Bartilucci Consulting Engineers (D&B), dated December 2001. The Sampling and Analysis Plan is part of the Sonia Road Post Closure Monitoring and Maintenance Plan (Volume 3 of 4).

1.1 Purpose

The purpose of the Post Closure Groundwater Monitoring Program is to monitor groundwater quality and flow direction following capping and closure of the Sonia Road Landfill.

This Post Closure Groundwater Monitoring Program Report includes discussions of the sample locations, sampling procedures, laboratory analyses, field and analytical results, data validation, groundwater level measurements and flow direction. In addition, this report includes a comparison of the analytical results of this sampling event (May 2004) to applicable New York State groundwater quality standards and guidance values, and groundwater sample results obtained during previous sampling events (first quarter 2004 routine sampling event and third quarter 2003 baseline sampling event).

1.2 Site Location and Description

The Sonia Road Landfill is a capped and closed inactive municipal solid waste landfill owned by the Town of Islip. The landfill is located at 1355 Howells Road in the hamlet of Brentwood in the western portion of the Town and is in close proximity to the western town boundary between the Towns of Islip and Babylon. The location of the Sonia Road Landfill is shown on Figure 1-1.

The landfill property is 42.2 acres in area and is approximately rectangular in shape. The landfill is bounded to the north by industrial properties, to the east by residential properties, to the south by Deer Park Street with residential properties beyond, and to the west by Howell's Road, Secatogue Road and Corbin Avenue with industrial properties beyond. In the southwest corner of the site is one residential parcel (Tax Map No. 221-2-1), which is not part of landfill property described above. At the northwest corner of the property is a 0.5-acre parcel owned by the Town of Islip (Tax Map No. 198-5-7.3), which is identified as a paper street. Given that the waste mass extends onto this parcel, it is considered as part of the landfill property, and as a result, the overall landfill property is considered to be 42.7 acres. At and abutting the northeast corner of the landfill property is the western extension of Sonia Road for which the facility is named.

The landfill property itself is zoned Industrial I and Industrial II with a small portion along the southeastern boundary zoned as residential.

To the southwest of the landfill property is the West Brentwood Middle School, which is located on the west side of Howell's Road. Beyond the school property to the south and west is the headwaters of Sampawams Creek. Sampawams Creek is fed by groundwater discharge as well as storm water drainage systems for the surrounding areas. Sampawams Creek runs from north to south and discharges into the Guggenheim Lakes, which are located north of the Southern State Parkway. Sampawams Creek generally describes the western boundary of the Town of Islip and the eastern boundary of the Town of Babylon.

The Sonia Road Landfill has been owned by the Town of Islip since 1965. Prior to 1965, the site was privately owned and used as a source of mined sand and gravel. As a result of this mining operation, virtually all of the site was disturbed, including the removal of vegetation, topsoil and underlying minerals. The mining operation was extensive with the removal of minerals progressing to and below the water table. Removal of minerals below the water table was accomplished through the use of dredging equipment. This activity resulted in the formation of a groundwater lake over a significant portion (40% to 50%) of the site. It is reported that dredging may have removed materials to a depth of 50 feet below the water table. Soil borings

constructed as part of the remedial investigation confirmed that waste lies at least 36 feet below the water table.

In 1965, the Town of Islip took title to the Sonia Road property and began a landfilling operation for the disposal of municipal solid waste. Landfilling of the site occurred between 1965 and 1977. The most active period of landfilling occurred between 1965 and 1974. It has been estimated that between 1.5 and 2.0 million cubic yards of waste was disposed of at the site. There are no weigh records to substantiate this estimate.

The landfill reportedly accepted all municipal solid waste delivered to the site. This waste is reported to have included wood, concrete, metal, plastic, glass, household waste in the form of refuse, rubbish, demolition materials and yard wastes (particularly leaves). It is also reported that junk automobiles were routinely disposed at the facility and that underground fires were common.

The Sonia Road Landfill was capped in the Fall of 2000. The landfill capping system covers an area of approximately 40 acres. The capping system includes an active landfill gas management system, an on-site storm water management system and a perimeter road constructed around the entire site, surfaced with recycled concrete aggregate. The storm water management system consists of a series of drainage swales, catch basins, buried storm water piping, dry wells and two recharge basins. Storm water associated with the northeast corner of the property is discharged to a series of dry wells (leaching rings) in the area of Sonia Road. The remainder of the site storm water is directed to Recharge Basins 1 and 2 located on the west side of the property. Recharge Basin 1 is located adjacent to the main entrance gate located on Corbin Avenue and Recharge Basin 2 is located in the southwest corner of the property. For the majority of the site, drainage swales are located on the in-board side of the perimeter road.

2.0 MONITORING WELL NETWORK AND GROUNDWATER SAMPLE LOCATIONS

The monitoring well network for the Sonia Road Landfill consists of 36 wells. Well locations are shown on Figure 2-1. The monitoring wells were constructed in 12 well clusters, with each cluster comprising a shallow (S) well, intermediate (I) well and deep (D) well. All 36 wells are utilized for water level measurements. Well construction information for all wells is summarized in Table 2-1.

Twenty-three (23) wells are included as part of the Post Closure Monitoring Program. The sampled wells are listed in Table 2-2.

Twenty-two (22) of the 23 monitoring wells were sampled as part of the second quarter 2004 Post Closure Groundwater Sampling event. Monitoring well MW-02S could not be sampled due to a well casing obstruction at approximately 23 feet below ground surface.

3.0 SAMPLING AND ANALYTICAL PROCEDURES

Sampling procedures for the Sonia Road Landfill site are described in the Sampling and Analysis Plan (SAP). Dedicated and disposable sampling equipment was used whenever possible in accordance with the SAP. All nondisposable equipment was decontaminated before first use on-site and between uses in accordance with the procedures described in the SAP. The following sections provide brief discussions of the procedures used during groundwater level measurements, organic vapor and combustible gas monitoring, groundwater sampling and sample analysis.

3.1 Groundwater Level Measurement

Prior to collecting the groundwater samples, synoptic water level measurements were obtained from all 36 monitoring wells for determination of groundwater elevations and groundwater flow direction. Groundwater level measurements were obtained from a survey measuring point on each well using an electronic water level indicator to an accuracy of 0.01 foot. A discussion of the groundwater level measurement results and groundwater flow direction is provided in Section 6.0.

3.2 Groundwater Sampling

Prior to collection of each groundwater sample, 3 to 5 well volumes were purged from the well. Well purging was accomplished by first measuring the static water level in the well and calculating the standing water volume. A decontaminated submersible pump was used to purge each well.

During the purging process, field parameters (pH, specific conductance, temperature, oxidation-reduction potential (Eh), dissolved oxygen and turbidity) were monitored and recorded. When the values of the field parameters, except turbidity, equilibrated within 10% based on the last two readings, the turbidity of the groundwater was less than 50 Nephelometric

Turbidity Units (NTUs) and at least three well volumes had been removed, well purging was considered complete.

Groundwater samples were collected using new, dedicated, disposable polyethylene bailers and polypropylene rope. Samples were collected immediately after purging. Filled sample bottles were stored in ice-filled coolers with the chain-of-custody forms and delivered on the day of collection to H2M Laboratories, Inc. for analysis. H2M Laboratories, Inc. is approved by the New York State Department of Health under the Environmental Laboratory Approval Program (ELAP) for the analyses performed.

Appropriate quality assurance/quality control (QA/QC) samples, which included field blanks, matrix spike and matrix spike duplicate (MS/MSD) sets and blind duplicates, were collected in accordance with the SAP. Trip blank samples accompanied all laboratory coolers.

Purge water from all on-site wells and all wells immediately adjacent to the landfill property was disposed directly into the nearest landfill capping system drainage swale. Purge water generated from off-site well clusters 11 and 12 was pumped into a tank truck, transported to the landfill and discharged into the landfill's on-site Recharge Basin 1 in accordance with the SAP.

Analytical results are summarized in Appendix A and are discussed in Section 4.2. Field forms for the second quarter 2004 sampling event, including field observation logs and daily equipment calibration logs, are contained in Appendices B-1 and B-2, respectively, and the chain-of-custody forms are provided in Appendix C.

3.3 Organic Vapor and Combustible Gas Monitoring

Total organic vapor and combustible gas measurements were collected in all 36 monitoring wells. Organic vapors were measured using a flame ionization detector (FID). Combustible gas was measured using a portable multi-gas meter. Gas monitoring results represent headspace measurements collected during the synoptic groundwater level

measurements. The results of the organic vapor and combustible gas monitoring are provided in Section 4.3.

3.4 Analytical Parameters

Groundwater samples collected during the second quarter 2004 sampling event were analyzed for 6 NYCRR Part 360 Baseline Parameters, including leachate indicators, inorganic parameters and volatile organic compounds (VOCs). The leachate indicators include alkalinity, ammonia, biochemical oxygen demand, bromide, chemical oxygen demand, chloride, total hardness (as $CaCO_3$), nitrate, total phenols, sulfate, total organic carbon, total dissolved solids and total kjeldahl nitrogen. Samples were analyzed in accordance with SW-846 methods as specified in the NYCRR Part 360 regulations. The analytical results for the groundwater samples are discussed in Section 4.2.

Section 4

4.0 ANALYTICAL RESULTS

4.1 Field Parameters

Table 4-1 provides a summary of the final field parameter values and field data measured for the second quarter 2004 sampling event.

4.2 Groundwater Samples

The second quarter 2004 analytical results for the groundwater samples, compared to NYSDEC Class GA groundwater standards and guidance values and to previous sample results, are provided in Appendices A-1 (leachate indicator parameters), A-2 (inorganic parameters) and A-3 (VOCs). Appendix A-4 contains historic trend graphs for alkalinity iron plus manganese, total dissolved solids and specific conductivity from selected upgradient and downgradient monitoring wells.

4.2.1 Leachate Indicators

The results of the leachate indicators for the groundwater samples are presented in Appendix A-1. As shown in the results table in Appendix A-1, two leachate indicator parameters, ammonia and chloride, were detected at concentrations exceeding Class GA standards in 6 of the 22 wells sampled during the second quarter 2004 sampling event. The remaining 16 wells did not contain any leachate indicator parameters at concentrations exceeding Class GA groundwater standards or guidance values. The leachate indicators that exceeded the Class GA standards are discussed below.

Ammonia

The groundwater standard for ammonia (2 milligrams per liter [mg/l]) was exceeded in five (5) wells (MW-04S, MW-04I, MW-04D, MW-05I and MW-06S). Ammonia concentrations in these wells ranged from 4.06 mg/l in well MW-04I to 6.45 mg/l well MW-04S.

Chloride

The groundwater standard for chloride (250 mg/l) was exceeded in MW-01D, which contained a chloride concentration of 656 mg/l.

4.2.2 Historic Leachate Indicators

A comparison of the leachate indicator results in the 22 wells sampled between the second quarter 2004 and the first quarter 2004 sampling events is provided below. Since well MW-02S was not sampled during the second quarter 2004 sampling event, it is not included in the comparison. Concentration trends and exceedances for each well are summarized in Table 4-2. Historic data for leachate indicator parameters are summarized in Appendix A-1.

Alkalinity

Four (4) of the 22 wells sampled showed an increase (defined as a change of at least 20% compared to the previous result) in alkalinity concentrations. The wells that showed an increase are MW-01I, MW-02I, MW-05I and MW-11D. Four (4) wells (MW-06D, MW-07I, MW-11S and MW-11I) showed a decrease (defined as a change of at least 20% compared to the previous result) in alkalinity concentrations. The remaining 14 wells were consistent (defined as within 20% of the previous result).

Ammonia

Eleven (11) wells (MW-01S, MW-01D, MW-02I, MW-03S, MW-04S, MW-04D, MW-05S, MW-05I, MW-06S, MW-11S and MW-12S) showed increasing concentrations of ammonia. Five (5) wells (MW-01I, MW-06I, MW-07I, MW-11D and MW-12I) showed decreasing concentrations. The remaining 6 wells were consistent.

4.2.3 Inorganic Parameters

The results of the inorganic parameters for the groundwater samples are presented in Appendix A-2. As shown by the second quarter 2004 analytical results, total chromium, iron, manganese and sodium were detected at concentrations above the Class GA groundwater standards. The following provides a discussion of these exceedances.

Total Chromium

The groundwater standard for total chromium of 50 micrograms per liter (ug/l) was exceeded in well MW-11s, which contained total chromium concentration of 64.7 ug/l.

Iron

Thirteen (13) wells (MW-01S, MW-03S, MW-04S, MW-04I, MW-04D, MW-05S, MW-05I, MW-06S, MW-06I, MW-06D, MW-11S, MW-11D and MW-12S) exceeded the

groundwater standard of 300 ug/l for iron. Iron concentrations for these wells with exceedances ranged from 330 ug/l in well MW-12S to 79,200 ug/l in well MW-04S.

Manganese

Fourteen (14) wells (MW-01S, MW-03S, MW-04S, MW-04I, MW-04D, MW-05S, MW-05I, MW-05D, MW-06S, MW-06I, MW-06D, MW-07I, MW-11S and MW-11I) exceeded the groundwater standard of 300 ug/l for manganese. Nine (9) wells (MW-01S, MW-01I, MW-01D, MW-03S, MW-04S, MW-04I, MW-05I, MW-11S and MW-12S) exceeded the groundwater standard of 20,000 ug/l for sodium. Sodium concentrations for these wells with exceedances ranged from 20,900 ug/l in well MW-03S to 448,000 ug/l in MW-01D.

4.2.4 Historic Inorganic Parameters

A comparison of the inorganic parameter results in the 22 wells sampled between the second quarter 2004 and the first quarter 2004 sampling events is provided below. For those parameters which were not included in the Part 360 Routine (first quarter 2004) sample event but included in the Baseline (second quarter 2004) sample event, the comparison is made to the previous Part 360 Baseline sampling event (third quarter 2003). Since well MW-02S was not sampled during the second quarter 2004 sampling event, it is not included in the comparison. Concentration trends and exceedances for each well are summarized in Table 4-3. Historic data for inorganic parameters are summarized in Appendix A-2.

Section 5

5.0 DATA VALIDATION

Twenty-two (22) groundwater samples, two blind duplicates, two matrix spike/matrix spike duplicate (MS/MSD) sets, two field blanks and five trip blanks were collected as part of the May 2004 Post Closure Groundwater Monitoring Program sampling event at the Sonia Road Landfill. The samples were analyzed for Baseline Parameters as listed in 6 NYCRR Part 360. Sample analysis was performed by H2M Laboratories, a contractor to the IRRA, in accordance with SW-846 methods as specified in the Part 360 regulations. H2M Laboratories is approved under the New York State Department of Health Environmental Laboratory Approval Program (ELAP) for the analyses performed.

The data package submitted by H2M Laboratories was reviewed for completeness and compliance with the analytical methods. All of the quality assurance/quality control (QA/QC) samples (calibrations, spikes, duplicates and blanks), as well as 20% of the analytical results, were reviewed yielding a "20% validation" in conformance with the Sampling and Analysis Plan. The samples that were reviewed for calculation and transcription errors were MW-03S, MW-05S, MW-05I, MW-07I and MW-12I. The findings of the review process are summarized below.

All samples were analyzed within the method specified holding times. All QA/AC requirements (calibrations, MS/MSDs, duplicates and blanks) were met.

Blind duplicates were collected from MW-12I (Blind Duplicate 1) and MW-05I (Blind Duplicate 2), and the results were comparable between the samples with the exception of hardness and alkalinity in Blind Duplicate 2 and sample MW-05I. The raw data were reviewed and no problems were identified. Two MS/MSD sets were collected (from MW-05S and MW-07I). All spike recoveries were within QC limits.

The chlorobenzene results for samples MW-07I, MW-11D and MW-11I, as well as the 1,4-dichlorobenzene result for sample MW-07I, have been qualified as nondetect. That is, the

method blank associated with these samples contained the same compounds and the sample results were less than the concentrations found in the blank.

No problems were found with the data package. All results are deemed valid and usable for environmental assessment purposes.

Completed data validation forms for the second quarter 2004 sampling event are provided in Appendix D.

6.0 GROUNDWATER LEVEL MEASUREMENTS AND FLOW DIRECTION

Groundwater level measurements were obtained on May 19, 2004, from each of the 23 monitoring wells included in the Post Closure Groundwater Monitoring Program and the 13 additional wells not sampled as part of this program. The depth to water measurements, measuring point elevations and calculated groundwater elevations for the 36 monitoring wells are presented in Table 6-1.

Water level data from May 19, 2004 were used to construct groundwater elevation contour maps for the shallow (water table), intermediate and deep upper glacial aquifer wells at and in the immediate vicinity of the Sonia Road Landfill. Water table and potentiometric surface (for the intermediate and deep wells) elevation contour maps are presented on Figures 6-1, 6-2 and 6-3, respectively. Groundwater flow within the zones screened by the shallow, intermediate and deep wells is predominantly toward the southeast in the vicinity of the landfill. These maps are consistent with the maps previously prepared for the site.

7.0 CONCLUSIONS AND RECOMMENDATIONS

7.1 Conclusions

Groundwater Flow

Based on groundwater level measurements collected during the second quarter 2004 and the shallow (water table), intermediate and deep potentiometric surface elevation contour maps constructed for the site, groundwater flow at and in the vicinity of the Sonia Road Landfill is predominantly toward the southeast. This groundwater flow direction is consistent with previous maps prepared for the site.

Groundwater Quality

Based on a comparison of the second quarter 2004 results to the first quarter 2003 results (Routine sampling event) or to the third quarter 2003 results (previous Baseline sampling event), and review of the historical trend graphs in Appendix A-4, groundwater quality in the vicinity of the Sonia Road Landfill has not changed substantially.

Since the only chromium concentration that exceeded the groundwater standard was in upgradient well MW-11S, the source of the detected chromium is not the Sonia Road Landfill.

Similarly, the detected concentrations of iron, manganese and sodium are likely not indicative of landfill-influenced groundwater, since concentrations of these parameters above groundwater standards were detected in both upgradient and downgradient wells.

The second quarter 2004 sample results showed that 4 of the 22 wells sampled each contained only one VOC at a concentration exceeding the Class GA groundwater standard. The VOCs detected at concentrations above standards were chloroethane, 1,1-dichloroethane (1,1-DCA) and cis-1,2-dichloroethene (cis-1,2-DCE). Chloroethane has previously been detected in downgradient wells and the concentration detected in MW-04I during this sampling event is

within the range of previous detections. Concentrations of 1,1-DCA and cis-1,2-DCE were only detected in wells upgradient of the landfill during this sampling event. Historic sample results indicate that VOCs are migrating beneath the landfill from an upgradient source or sources. These results are consistent with that conclusion.

7.2 Recommendations

Based on the second quarter 2004 results and comparison of these results to historic data for the Sonia Road Landfill, it is recommended to continue to sample the groundwater monitoring wells in accordance with the SAP.

Due to the damaged well casing identified for well MW-02S, it is recommended that well MW-02S be abandoned and replaced with a new monitoring well. Since the landfill cap in this area extends to the northern property boundary, it is likely that the replacement well would need to be located on an adjacent property.

22 wells, 2 FB, 2 MS/MSD's and 2 duplicates were collected and analyzed for Baseline parameters, % trip blanks were collected and analyzed for VOCs

Blind dup#1 is a duplicate of MW-12I, Blind dup#2 is a duplicate of MW-05I

For Blind dup#2 the all results were comparable with the exception of alkalinity and hardness which had alkalinity higher in the duplicate (184 vs 439) and hardness lower on the duplicate (750 vs 220)

RESULTS OF BLIND DUP#1 were comparable to the sample results for MW-12I

IV. Blank Summary

A. Method Blanks

1. Was a method blank prepared and analyzed at the contract specified frequency?

   Yes

2. Were all the analytes below the CRDL in the method blank?

   Yes

Comments:

B. Calibration Blanks

1. Were all initial and continuing calibration blanks analyzed at the contract specified frequency/

   Yes

2. Were all the analytes below the CRDL in all the calibration blanks?

   Yes

V. Duplicate Analysis

1. Was a duplicate prepared and analyzed at the contract specified frequency?

   Yes

   Comments:

2. Were control limits for the relative percent differences (RPD) met for each analyte?

   Yes

   Comments:

For sample values >5 times the CRDL, the RPD control limit is ±20%.

For sample values >5 times the CRDL, the RPD control limit is ±CRDL.

If sample results were outside of the control limits, all data associated with that duplicate sample should have been flagged with a "*".

VI. Matrix Spike Analysis

1. Was a matrix spike prepared and analyzed at the contract specified frequency?

   Yes

   Comments:

2. Were the matrix spike recoveries within the contract specified control limits (75-125%)?

   Yes

   If "No", note analytes _____

   Data should have been flagged with "N" for analytes out of control limits. If the sample concentration exceeds the spike concentration by a factor of four or more, no flag is required.
