RE: National Heatset Printing
Operation & Maintenance Report, February 2004
1 Adams Boulevard
Farmingdale, New York
NYSDEC Site 1-52-140

Dear Mr. Dyber:

This letter provides an overview of the ongoing operation of the soil vapor extraction (SVE) system for the National Heatset Printing Site in Farmingdale, New York (**Figure 1**) for the reporting period including February 2004. A site visit was performed by Shaw Environmental and Infrastructure Engineering of New York, P.C. (Shaw) personnel on February 9, 2004 in accordance with our contract with the Department.

### System Operation

Operation of SVE system began on September 17, 2002. The SVE system has been operational for approximately 70% of the reporting period. The system operational data is summarized in **Table 1** and is presented as **Appendix A**.

The SVE blower operated at a flow of approximately 172 cfm and a vacuum of 70 inches of water column as observed during the site visit. A flow of 121 cfm and a vacuum of 44 inches of water column were observed at the extraction well. The extraction well and dilution valves were both 50% open. Volatile organic compound (VOC) and tetrachloroethene (PCE) concentrations from the extraction well were observed to be 23.1 and 10 ppm, respectively. The positioning of the well extraction and dilution air valves will be modified based on continued monitoring of VOC concentrations.

No water was collected from the knockout vessel during this reporting period. A small quantity of water has been collected during the previous reporting periods and placed in an accumulation

drum for storage until the drum has been filled, at which time proper characterization and disposal procedures will be followed.

VOC concentrations of 29.8 ppm and a PCE concentration of 25 ppm were observed at the VGAC influent port during the site visit. VOC concentrations of 41.4 ppm and a PCE concentration of 25 ppm were observed at the VGAC mid sampling port. However, non-detect VOC and PCE concentrations were observed from the VGAC effluent sampling port during the site visit. A carbon change out will be scheduled during March 2004 to prevent the potential for breakthrough of the lag VGAC unit.

## **Monitoring Probes**

A vacuum of 1.8 inches of water column was observed at vapor monitoring point VP-1, 0.05 inches of water column was observed at vapor monitoring point VP-2, and no vacuum was observed at VP-3 during the site visit. The vapor points will continue to be monitored during future site visits.

# PCE Removal

The SVE system removed approximately 126 pounds of PCE from the extraction well during this reporting period and has removed approximately 2,283 pounds of PCE to date. A summary of the estimated PCE mass removal over time is presented in **Table 2**.

# Air Discharge Monitoring

Shaw personnel collected a sample of the system effluent air for laboratory analyses during the site visit. The laboratory analysis revealed non-detect PCE and trichloroethene concentrations in the system effluent sample. However, cis-1,2-Dichloroethene was detected in the effluent sample at a concentration of 10 mg/m<sup>3</sup>. Analytical results are summarized in **Table 3** and the laboratory report of analyses is presented as **Appendix B**.

Field monitoring of the system discharge conducted during the site visit indicated non-detect concentrations of PCE and total VOCs. A summary of the field monitoring and laboratory air discharge monitoring results is presented as **Table 4**.

## Conclusions and Recommendations

Based on the data collected from the SVE system during this reporting period, Shaw recommends continued operation of the SVE system at 1 Adams Boulevard. As site conditions change, adjustments will be made to optimize the system operation.

Please do not hesitate to contact me at 518-783-1996 with any questions you might have regarding this report.

Sincerely,

Shaw E & I Engineering of New York, P.C.

John A. Skaarup Project Engineer

### Notes:

PID = Total VOC concentration measured with photoionization detector

ppm = parts per million (volume/volume basis)

PCE = Tetrachloroethene (PCE) concentration measured with Drager tube of 10-500 ppm range

scfm = standard cubic feet per minute

cfm = cubic feet per minute

Influent SVE = Readings collected between the SVE Blower and the Carbon Units

Mid GAC = Readings collected between the lead and lag carbon units

Effluent GAC = Readings collected after the lag carbon unit

GAC = granular activated carbon unit

-- = measurement not recorded

# **Project Narrative**

This data report includes the analysis results for one (1) air sample in a Tedlar bag that was received from Shaw Environmental & Infrastructure, Inc on February 10, 2004. Analyses were performed per specification in the Chain of Custody form. For reference, a copy of the Mitkem Work Order form is included for cross-referencing the client sample ID and laboratory sample ID.

All of the analyses were performed according to method specifications, as modified by Mitkem. No unusual occurrences were noted during sample analysis.

All pages in this report have been numbered consecutively, starting with the title page and ending with a page saying only "Last Page of Data Report".

This data report has been reviewed and is authorized for release as evidenced by the signature

Edward A. Lawler

Laboratory Operations Manager

# Data Flag/Qualifiers:

- U Not Detected. This compound was analyzed-for but not detected. For Organics analysis the reporting limit (lowest standard concentration) is the value listed. For Inorganics analysis, the value listed is the detection limit. For Inorganics analyzed using SW-846 methods, the detection limit is the Method Detection Limit, for Inorganics analyzed using EPA CLP and NY ASP CLP methods, the detection limit is the Instrument Detection Limit.
- J For Organics analysis, this flag indicates an estimated value due to either
  - the compound was detected below the reporting limit, or
  - estimated concentration for Tentatively Identified Compound
- B For Organic analyses, this flag indicates the compound was also detected in the associated Method Blank. The B flag has an alternative meaning for Inorganics analyses, indicating a "trace" concentration below the reporting limit and equal to or above the detection limit.
- D For Organics analysis, this flag indicates the compound concentration was obtained from a diluted analysis
- E For Organics analysis, this flag indicates the compound concentration exceeded the Calibration Range. The E flag has an alternative meaning for Inorganics analyses, indicating an estimated concentration due to the presence of interferences, as determined by the serial dilution analysis.
- P This flag is used for Pesticides/PCB/Herbicide compound when there is a greater than 40% difference for detected concentration between the two GC columns used for Primary and Confirmation analyses. This difference typically indicates an interference, causing one value to be unusually high. The **lower** of the two values is reported in the Analysis Report.
- A Used to flag Semivolatile Organic Tentatively Identified Compound library search results for compounds identified as aldol condensation byproducts.
- N Used to flag results for Volatile and Semivolatile Organics analysis
  Tentatively Identified Compounds where an analyte has passed the
  identification criteria, and is considered to be positively identified. For
  Inorganics analysis the N flag indicates the matrix spike recovery falls
  outside of the control limit.
- \* For Inorganics analysis the \* flag indicates Relative Percent Difference for duplicate analyses is outside of the control limit.
