1.0 Introduction

1.1 General

This summary report documents the groundwater sampling event conducted in September 2016 at the Korkay Inc. Site (Site No. 518014), located at 70 West Main Street in the Village of Broadalbin, Fulton County, New York (Figure 1). The sampling was conducted for Work Assignment No. D004445-20.1 of the State Superfund Standby Contract between the New York State Department of Environmental Conservation (NYSDEC) and AECOM Technical Services Northeast, Inc. (AECOM).

1.2 Background and Objectives

Korkay, Incorporated (Korkay) was a supplier of detergents, solvents, and degreasers to the automotive industry from 1969 to 1980. Releases of chemicals at the Site contaminated soil and groundwater. Remedial actions undertaken by the NYSDEC and New York State Department of Health (NYSDOH) to date have been effective in reducing Site contamination, although subsurface soil and groundwater impacts still exist.

Groundwater investigations were conducted at the Site in July 2014 and August 2015 to further delineate and characterize on-Site and off-Site dissolved-phase groundwater impacts. In September 2015, 8 new monitoring wells (MW-17 through MW-24) were installed to aid in monitoring the nature and extent of groundwater impacts on and off Site.

The most recent 5-quarter groundwater sampling event, which is required as part of the Site Management Plan (SMP) to evaluate groundwater quality trends through the Site management phase, was completed between October 12 and 15, 2015. All on-Site and off-Site groundwater monitoring wells (Figure 2) were sampled during the event. The results of that sampling documented the extent of the groundwater contaminant plume in the shallow aquifer. A copy of the isoconcentration contour map of total volatile organic compounds (TVOCs) detected in the shallow aquifer wells during the October 2015 sampling event is included as Figure 3.

A supplemental remedial action, consisting of in-situ chemical oxidation (ISCO) injection, was conducted at the Site between October 19 and 23, 2015. The purpose of the ISCO injection was to attempt to further remediate residual soil and groundwater contamination to meet the remedial goals established for the Site. The remediation included the installation of 95 injection points. The points were installed with a direct push Geoprobe® unit. The oxidant used was activated persulfate, specifically, PersulfOx® from Regenesis Remediation Services. This oxidant has been shown to effectively reduce VOC mass with limited oxidation of certain pesticides. PersulfOx® is a catalyzed persulfate which does not require any additional activation. The PersulfOx® was applied concurrently with oxygen release compound Advanced (ORC-A®), a product that provides a sustained release of oxygen which will allow for polishing of COCs through aerobic bioremediation.

This report presents and interprets analytical results for the groundwater sampling conducted on September 14, 2016, as well as results from previous post-ISCO injection quarterly sampling events. The sampling event represented the fourth of eight quarterly events to be conducted over a 2-year period to monitor and evaluate the effectiveness of the ISCO treatment. The quarterly monitoring program is scheduled to continue through the summer of 2017.

2.0 Groundwater Sampling

Post ISCO injection groundwater monitoring will take place for two years following treatment to assist in evaluating the effectiveness of the ISCO injection. The monitoring is performed in accordance with the approved ISCO Work Plan, dated August 8, 2015. The ISCO Work Plan requires that groundwater samples be collected on a quarterly basis from five on-site groundwater monitoring wells (i.e., ASW, MW-17, MW-18, MW-22 and MW-23). Based on the recommendation made in the report for the December 8, 2015 monitoring event, off-site downgradient well MW-21 was added to the monitoring network for subsequent events. Well locations are shown in Figure 2.

2.1 Groundwater Sampling Methodology

Prior to purging, groundwater levels were recorded in all wells on site. The water level meter was decontaminated using deionized water and a non-phosphate detergent between each well. The groundwater was then purged with a peristaltic pump and new polyethylene tubing from the wells to be sampled. The end of the dedicated tubing was placed at the center of each well screen. Purging was conducted using low-flow techniques so that disturbances in the well and changes in water level did not occur. Water was pumped continuously and flow-rate was recorded between each 3 to 5 minute interval.

Water quality parameters were recorded using a multi parameter meter with a flow through cell. The parameters were recorded every 3 to 5 minutes until readings indicated that the groundwater stabilized. These parameters monitored included turbidity, temperature, specific conductivity, dissolved oxygen, pH, and oxygen reduction potential (ORP). Stabilization was considered complete when three consecutive readings recorded levels within the following parameters:

- Turbidity - 10% for values greater than one Nephelometric Turbidity Units (NTU)
- DO - 10%
- Specific conductance - 3%
- Temperature - 3%
- pH - ± 0.1 unit
- ORP/Eh - ± 10 millivolts

Following the collection of field parameter readings, a CHEMets® Model K-7870 field test kit was used to assess the presence and relative concentration in parts per million (ppm) of persulfate present in the purge water from each monitoring well. The test results were recorded along with the standard field parameter readings on the groundwater sampling forms (Appendix A).

The groundwater samples were then collected in the appropriate bottleware provided by NYSDEC's callout laboratory, TestAmerica, who conducted all the sample analyses. Each groundwater sample was analyzed for volatile organic compounds (VOCs) by USEPA Method 8260C, SVOCs by Method 8270D and organochlorine pesticides by Method 8081B. The laboratory analytical report is included in Appendix B.

3.0 Results

3.1 Groundwater Elevation and Flow

Water level measurements were obtained prior to sampling the wells. These depth-to-water measurements were converted to water table elevations using top-of-casing elevations surveyed in November 2015.

The groundwater table elevation data, provided in Table 1, was used to produce a water table contour map of the shallow aquifer, as presented on Figure 4. Groundwater flow in the shallow water-bearing zone is from northeast to southwest, as historically observed.

3.2 Analytical Results

The analytical results for the six wells sampled during the September 2016 quarterly groundwater sampling event are presented in Table 2. Results from the October 2015 5-quarter sampling event (pre-ISCO injection baseline event) and post-ISCO injection quarterly events to date are also included. The data compilation in Table 2 is provided to show baseline conditions prior to the ISCO treatment and the trends in results since the treatment.

In Table 2, concentrations above relevant New York State Ambient Water Quality Standards or guidance values (AWQS) are in a shaded cell with bold typeface for ease of identification. Bolded text alone indicates a detection of the compound above the method detection limit, but below the relevant AWQS. Table 2 also includes the field parameter readings for dissolved oxygen (DO) and oxidation-reduction potential (ORP), and the persulfate test kit results.

Volatile Organic Compounds

Chart 1 depicts the trend in the TVOC concentration in well ASW, a pre-existing well located in the former source area with the longest sample history of the wells being monitored. Chart 2 depicts TVOC trends in the four on-Site wells (MW-17, MW-18, MW-22 and MW-23) and off-Site well MW-21. The September 2016 VOC analytical results and TVOC data trends to date are discussed below.

- The TVOC concentration in upgradient well MW-17 (230.2 mg/L in the field duplicate sample) was a decrease over the previous result (424 mg/L), and remains below the October 2015 baseline concentration (591.5 mg/L). Eight compounds were detected at concentrations above relevant AWQSs. Persulfate was measured at approximately 0.7 ppm, and there was essentially no DO measured in the well (0.38 mg/L). The data indicates that oxygen and persulfate levels are depleted suggesting that further aerobic biodegradation may be unlikely to occur in the vicinity of this well.
- VOCs were detected in well MW-18 at a total VOC concentration of 41.4 mg/L after they were not detected during the previous (May 2016) sampling event. Six compounds were detected, including concentrations of O-Xylene (8.5 mg/L) and Tetrachloroethene (PCE) (11 mg/L) that slightly exceeded the relevant AWQSs. This indicated a slight increase in exceeding compounds, but still illustrates a significant decreasing trend in the total VOC

concentration since the December 2015 event (122.2 mg/L) and October 2015 baseline concentration (1,272.4 mg/L). The data indicates that the ISCO treatment has effectively reduced contaminant levels in this well. Persulfate (70 ppm) and DO (24.88 mg/L) levels remained slightly elevated in this well compared to the other wells that were sampled.

- The TVOC concentration in cross gradient well MW-22 (7.7 mg/L) decreased relative to the May 2016 result (14.2 mg/L). This represents a fourth consecutive event with continued decreasing concentrations relative to the October 2015 baseline concentration (108.3 mg/L). No compounds were detected with concentrations above AWQSs. Persulfate and DO was measured at levels of 14 ppm and 0.82 mg/L, respectively, indicating some ISCO treatment chemical may still be present in the well that could further reduce contaminant levels in this area.
- The TVOC concentration in the former source area well ASW (2,785 mg/L) decreased somewhat from the May 2016 result (3,525 mg/L). The field parameter test results indicate that persulfate (2.1 ppm) and DO (0.31 mg/L) are depleted in this well. These readings indicate that oxygen levels in the vicinity of this well are likely insufficient to support further reduction in contaminant mass.
- The TVOC concentration in well MW-23 (2,129.4 mg/L), located at the downgradient Site boundary, decreased slightly from the May 2016 event (2,300.5 mg/L), although it was still greater than the October 2015 baseline result (521.9 mg/L). The field parameter test results indicate that persulfate (1 ppm) and DO (0.27 mg/L) are depleted in this well. As with well ASW, this data indicates that oxygen levels in the vicinity of this well may be insufficient to support further reduction in contaminant mass.
- The TVOC concentration in off-site downgradient well MW-21 (342.9 mg/L) represented a significant increase from the May 2016 event (1.8 mg/L) and only a slight decrease from the October 2015 baseline result (453 mg/L). The results indicate that groundwater contaminant levels in this well may be subject to seasonal fluctuations. The persulfate level (0.7 ppm) remained the same from the May event and the DO level (0.25 mg/L) decreased.

Semi-Volatile Organic and Organochlorine Pesticides Compounds

As shown in Table 2, the September 2016 SVOC analytical results were generally similar to the previous quarterly sample results. Contaminants detected at concentrations above the relevant AWQS were reported for only one compound (naphthalene), and those exceedances were reported in only two wells (ASW and MW-23). Review of Table 2 shows that the SVOC concentration trends since October 2015 generally mimic the TVOC trends described above.

For the organochlorine pesticides sample results, four wells had compounds with concentrations above AWQSs. ASW and MW-18 had exceedances for Alpha-BHC (0.086 mg/L and 0.058 mg/L, respectively). MW-17 had an exceedance of Aldrin at a concentration of 0.064J mg/L (0.059J mg/L in the field duplicate sample). And MW-22 had exceedances of Aldrin (0.069J mg/L), Alpha-BHC (0.019J mg/L), Dieldron (0.064J mg/L), and Heptachlor Epoxide (0.082J mg/L). All other results were either non-detect or less than relevant AWQSs. This generally marks an improving trend from the October 2015 baseline results.

4.0 Summary and Conclusions

From the review of the September 2016 sampling results along with the October 2015 baseline and subsequent post-ISCO injection results, the following observations with respect to groundwater contaminant trends are made:

- The data from MW-17 indicates that further aerobic biodegradation may be unlikely to occur and there is potential for some rebound in TVOC concentration to occur in this upgradient area of the Site. This could be a result of depleted persulfate and DO levels and/or the potential for inflow of residual groundwater impacts from the northern Site periphery, outside the ISCO treatment area.
- TVOC concentrations decreased slightly in the former source area well ASW. Concentrations decreased slightly in MW-23 at the downgradient site boundary, but remain well above AWQSs. The levels of sodium persulfate and DO in these wells appear to be depleted, suggesting that further aerobic biodegradation is unlikely to occur in this highly impacted area of the Site.
- TVOC concentrations continued to remain low near the center (MW-18) and western cross-gradient (MW-22) areas of the Site. In all likelihood, the concentration changes in these wells reflect the effects of the ISCO treatment in an area of the Site outside the main former source location, and where no significant residual soil contamination remains.
- Persulfate and DO levels in well in the center of the Site (MW-18) increased somewhat from the May results, indicating there is possibly some residual ISCO chemicals in this area to disperse further downgradient to the more highly impacted source area (wells ASW and MW-23).
- The SVOC concentration trends in all wells sampled in the quarterly sampling events to date essentially mimic the TVOC trends. Therefore, there does not appear to be a need to continue to collect SVOC data during the remaining post-ISCO quarterly sampling events; the TVOC data trends alone will be adequate to monitor changes in contaminant levels.
- The organochlorine pesticide concentration trends have remained fairly constant in all wells sampled during the quarterly sampling events to date. Based on this, and considering that the contaminant trend analysis for the post-ISCO monitoring program is based primarily on the VOC data, it may be acceptable to discontinue pesticide analyses from the remaining quarterly events and continue the pesticide analysis for future annual (five-quarter) events only.

5.0 Recommendations

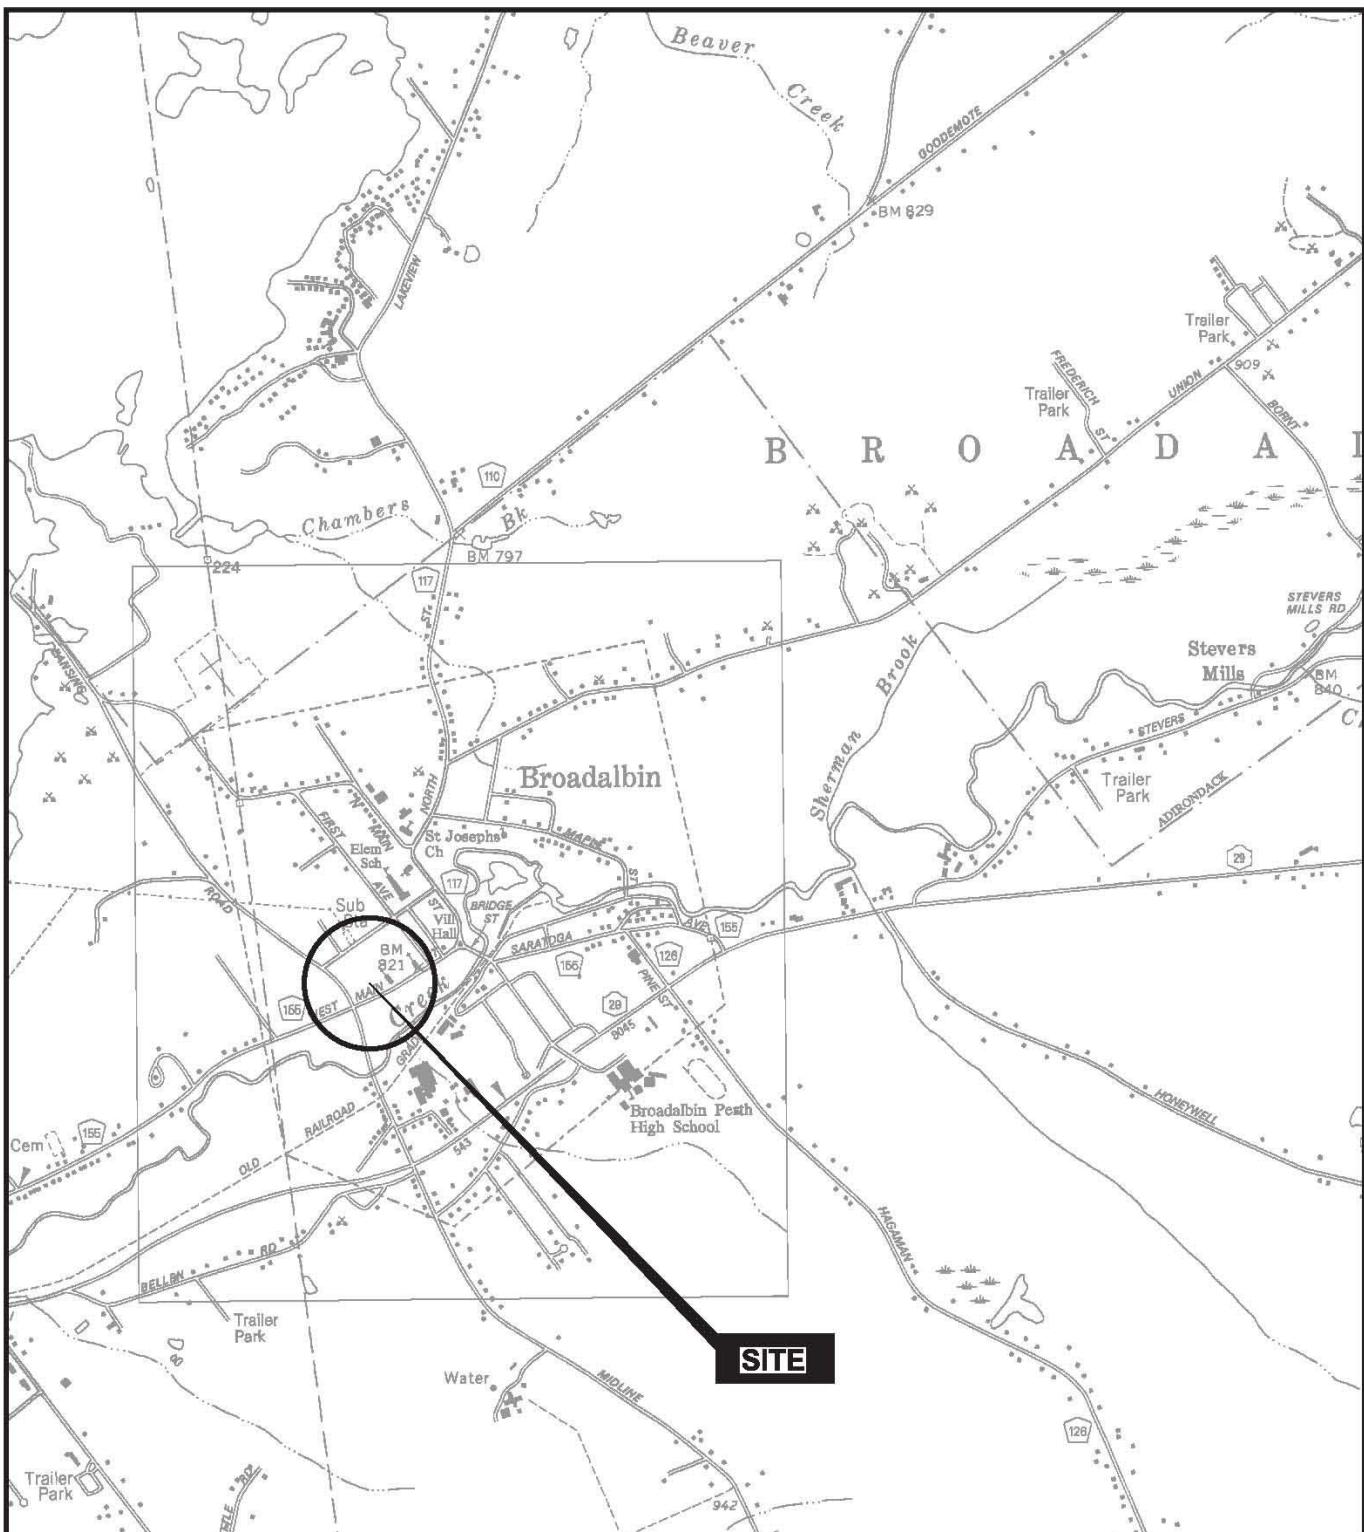

Based on the results of this monitoring event, and review of the TVOC trends to date, it is recommended that the 6 wells included in the present monitoring well sampling program (i.e., ASW, MW-17, MW-18, MW-21, MW-22 and MW-23) be unchanged for the next quarterly sampling event (September, 2016).

Changes in groundwater quality will continue to be monitored and evaluated for evidence of contaminant reduction during future quarterly sampling events. The review of changes in groundwater quality and additional recommendations will be provided as deemed necessary.

Based on the quarterly data generated to date, it appears that it would be acceptable to omit the SVOC and organochlorine pesticide sample analyses from the remaining quarterly post-ISCO sampling events.

The results of post-ISCO quarterly monitoring to date indicate that the level of active persulfate remaining in the injection area is unlikely to further reduce contaminant mass. Similarly, the amount of residual ORC in the injection area to promote aerobic degradation and reduce contaminant mass is low. Because of this, it is recommended that a second round of ISCO treatment be administered, targeted on the residual hot spot areas of the Site.

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed within the body of this report. Release of the data contained in this sample data package and in the electronic data deliverable has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

Joe Giacomazza

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC/MS Semi VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
*	LCS or LCSD is outside acceptance limits.
X	Surrogate is outside control limits

GC Semi VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
X	Surrogate is outside control limits
B	Compound was found in the blank and sample.

Glossary

Abbreviation

These commonly used abbreviations may or may not be present in this report.

□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Narrative

Job Narrative 480-105978-1

Receipt

The samples were received on 9/15/2016 1:45 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 0.6° C.

GC/MS VOA

Method(s) 8260C: The following volatiles samples were diluted due to foaming at the time of purging during the original sample analysis: MW-17 091416 (480-105978-2) and MW-18 091416 (480-105978-3). Elevated reporting limits (RLs) are provided.

Method(s) 8260C: The following samples were diluted to bring the concentration of target analytes within the calibration range: DUP-1 091416 (480-105978-1), ASW 091416 (480-105978-5) and MW-23 091416 (480-105978-6). Elevated reporting limits (RLs) are provided.

Method(s) 8260C: The following volatiles sample was diluted due to foaming at the time of purging during the original sample analysis: MW-22 091416 (480-105978-4). Elevated reporting limits (RLs) are provided.

Method(s) 8260C: The following sample was diluted to bring the concentration of target analytes within the calibration range: MW-21 091416 (480-105978-7). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC/MS Semi VOA

Method(s) 8270D: The continuing calibration verification (CCV) associated with batch 480-321244 recovered above the upper control limit for 2,4-Dinitrophenol, 4,6-Dinitro-2-methylphenol, 4-Nitrophenol and Pentachlorophenol. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following samples are impacted: DUP-1 091416 (480-105978-1), MW-17 091416 (480-105978-2), MW-18 091416 (480-105978-3), MW-22 091416 (480-105978-4), ASW 091416 (480-105978-5), MW-23 091416 (480-105978-6) and MW-21 091416 (480-105978-7).

Method(s) 8270D: The laboratory control sample (LCS) for preparation batch 480-320630 and analytical batch 480-321244 recovered outside control limits for the following analytes: 2,4-Dinitrophenol and 4-Nitrophenol. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method(s) 8270D: The laboratory control sample (LCS) for preparation batch 480-320630 and analytical batch 480-321244 recovered outside control limits for the following analyte: Benzaldehyde. Benzaldehyde has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed. These results have been reported and qualified.

Method(s) 8270D: The following samples were diluted to bring the concentration of target analytes within the calibration range: ASW 091416 (480-105978-5) and MW-23 091416 (480-105978-6). Elevated reporting limits (RLs) are provided.

Method(s) 8270D: Six surrogates are used for this analysis. The laboratory's SOP allows one acid and one base of these surrogates to be outside acceptance criteria without performing re-extraction/re-analysis. The following samples contained an allowable number of surrogate compounds outside limits: ASW 091416 (480-105978-5) and MW-23 091416 (480-105978-6). These results have been reported and qualified.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC Semi VOA

Method(s) 8081B: The following samples were diluted due to the nature of the sample matrix: DUP-1 091416 (480-105978-1), MW-17 091416 (480-105978-2), MW-18 091416 (480-105978-3), ASW 091416 (480-105978-5), MW-23 091416 (480-105978-6) and MW-21 091416 (480-105978-7). As such, surrogate recoveries are below the calibration range, are estimated and not representative. Elevated reporting limits (RLs) are provided.

Case Narrative

Client: New York State D.E.C.

Login Sample Receipt Checklist

Client: New York State D.E.C.

Job Number: 480-105978-1

Login Number: 105978

List Source: TestAmerica Buffalo

List Number: 1

Creator: Williams, Christopher S

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	True	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time (Excluding tests with immediate HTs)..	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
If necessary, staff have been informed of any short hold time or quick TAT needs	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Sampling Company provided.	True	AECOM
Samples received within 48 hours of sampling.	True	
Samples requiring field filtration have been filtered in the field.	N/A	
Chlorine Residual checked.	N/A
