Statement of Purpose

The purpose of the Installation Action Plan (IAP) is to outline the total multiyear cleanup program for an installation. The plan identifies environmental cleanup requirements at each site or area of concern (AOC), and proposes a comprehensive, installation-wide approach, along with the costs and schedules associated with conducting investigations and taking the necessary remedial actions (RA).

In an effort to coordinate planning information between the restoration manager, the US Army Environmental Command (USAEC), Fort Drum (FTD), the executing agencies, regulatory agencies, and the public, an IAP was completed. The IAP is used to track requirements, schedules, and tentative budgets for all major Army installation cleanup programs.

All site-specific funding and schedule information has been prepared according to projected overall Army funding levels and is, therefore, subject to change.

Installation Information

Installation Locale

Installation Size (Acreage): 107265 City: Fort Drum County: Jefferson, Lewis State: New York Other Locale Information

The installation is located in northern New York State, approximately 16 kilometers northeast of Watertown, in Jefferson and Lewis counties, and it borders St. Lawrence County. Seven small towns with populations between 2,000 and 8,000 each border the installation. Approximately 31,000 military personnel, their dependents, and civilian employees reside and/or work at FTD on a daily basis. The installation, which is roughly rectangular, consists of 107,265 acres measuring 10 kilometers wide and 32 kilometers long, making it the largest Army installation in the northeast.

Installation Mission

Fort Drum's mission is to command the active components, units and individuals assigned to the installation, provide administrative and logistical support to tenant activities, provide support to all units in training to include active and reserve components, and to plan for and support mobilization, deployment and annual training of almost 50,000 reserve component Soldiers.

Affected Media of Concern: Groundwater, Soil

5-Year / Periodic Review Summary

No 5-Year / Periodic Reviews have been scheduled

Installation Historic Activity

The installation has been used as a military training site since 1908; however, the Army's presence in the New York North Country may be traced back to the early 1800s.

In 1809, a company of infantry soldiers was stationed at Sackets Harbor to enforce the Embargo Act and control smuggling between northern New York and Canada. Following the outbreak of the War of 1812, Sackets Harbor became the center of United States naval and military activity for the upper St. Lawrence River Valley and Lake Ontario.

During the 1830s and 1840s, the Patriots War in Canada prompted a new round of military preparations and Madison Barracks became the home of artillery units.

Learning that the war department was looking for areas in northern New York to train the troops, the Watertown Chamber of Commerce proposed that the Army establish a training area on 10,000 acres of land along the Black River in the vicinity of Felts Mills, Great Bend and the village of Black River.

In 1908 Brigadier General Frederick Dent Grant, son of General Ulysses S. Grant, was sent to the area with 2,000 regulars and 8,000 militia. He found Pine Plains to be an ideal place to train troops. The following year, money was allocated to purchase the land and summer training continued through the subsequent years. The camp's first introduction to the national spotlight came in 1935, when the largest peacetime maneuvers were held on Pine Plains and surrounding farmlands.

The 36,500 soldiers came from throughout the northeast to take part in the exercise. Some soldiers traveled by trains which arrived in town every 15 minutes, coming from as far away as Buffalo and New York City. For 36 hours, young men from offices, factories, and farms marched, attacked, and defended in tactical exercises on the 100 square miles the Army had leased for its war games. The maneuvers were judged to be most successful, and the war department purchased another 9,000 acres of land.

With the outbreak of World War II (WWII), the area then known as Pine Camp was selected for a major expansion and an additional 75,000 acres of land was purchased. With that purchase, 525 local families were displaced. Five entire villages were eliminated, while others were reduced by one-third to one-half their size.

By Labor Day 1941, 100 tracts of land were taken over. Three thousand buildings, including 24 schools, six churches and a post office were abandoned. Contractors then went to work, and in a period of 10 months at a cost of \$20 million, an entire city was built to house the divisions scheduled to train.

Eight hundred buildings were constructed, including 240 barracks, 84 mess halls, 86 storehouses, 58 warehouses, 27 officers' quarters, 22 headquarters buildings, and 99 recreational buildings, as well as guardhouses and a hospital. Construction workers paid the price, as winter 1941-1942 was one of the coldest in New York North Country history.

The three divisions to train at Pine Camp were General George S. Patton's 4th Armored Division (General Creighton Abrams was a battalion commander at the time), the 45th Infantry Division, and the 5th Armored Division.

The post also served as a prisoner-of-war camp. Of those prisoners who died at the post, one Italian and six Germans are still buried in the Sheepfold Cemetery near Remington Pond.

In 1951 Pine Camp became Camp Drum, after Lt. Gen. Hugh A. Drum who commanded the First Army during WWII. During and after the Korean Conflict, a number of units were stationed and trained at the camp to take advantage of the terrain and climate.

The post was designated FTD in 1974 and a permanent garrison was assigned. In April 1980, B Company, 76th Engineer Battalion (Combat Heavy) was reassigned to FTD from Fort Meade, Maryland. It was followed by the rest of the battalion, less Company D, three years later.

In January 1984, the Department of the Army announced it was studying selected Army posts to house a new light infantry division. On Sept. 11, 1984, the announcement was made that FTD would be the new home of the 10th Light Infantry Division.

The first division troops arrived at FTD on Dec. 3, 1984, and the unit was officially activated on Feb. 13, 1985. At that time the name was changed to the 10th Mountain Division (Light Infantry). The mission of the 10th Mountain Division is to rapidly deploy by air, sea, and land anywhere in the world, prepared to fight upon arrival and win.

Installation Historic Activity

On June 4, 1985 the identity of a roundout brigade was announced. The brigade was composed of New York Army National Guard battalions from central and northern New York under the 27th Infantry Brigade.

On June 28, 1985 the 76th Engineer Battalion was inactivated. The division reached full strength in 1989. Between 1986 and 1992, 130 new buildings, 35 miles of roads, and 4,272 sets of family housing units were built at a cost of \$1.3 billion.

Since the early-1990s, FTD has continued to construct and expand facilities to include training ranges, a new 10,000-foot runway at the airfield, and support facilities for rapid deployment.

Installation Program Cleanup Progress

| IRP | |
|------------------------|---|
| Prior Year Progress: | The corrective measures implementation (operation)(CMI(O)) was continued at FTD-030A, 030B, 030C, 030D, 030E, 030F, 031, 089, and 091; long-term management (LTM) continued at FTD-007 and FTD 008 under a performance-based acquisition (PBA) contract. PBA contractor continued use of ozone sparging at FTD-030A and 091 and nutrient application at FTD-031, 089, 030B, C, D to accelerate planned closure. Planned closure of FTD-030B, 030C, 031, 089, and 091 by Dec. 31, 2010 per PBA contract was delayed. |
| Future Plan of Action: | CMI(O) will continue at FTD-030A, 030B, 030C, 030D, 030E, 030F, 031, 089, and 091. Closure is planned at FTD-030A, 030B, 030C, 031, 089, and 091 based on expected revised PBA contract target dates. LTM will continue at FTD-007 and FTD-008. |
| Prior Year Progress: | RA for CCFD-10470W was completed and a request for no further action (NFA) approval was requested from NYSDEC. CCFD-030G remedial investigation (RI) of tetrachloroethylene (PCE) contamination continued. A new site (CCFD-030H) was identified and an RI/feasibility study (FS) and interim remedial action (IRA) are planned. |
| Future Plan of Action: | An RI/FS will be completed at CCFD-030G and a remedial design (RD)/remedial action -construction [RA(C)] initiated. An RI/FS and IRA for CCFD-030H are to be completed. |

Contamination Assessment Overview

Studies of potentially contaminated sites at FTD began in 1980 when the US Army Toxic and Hazardous Materials Agency (USATHAMA) conducted an installation assessment. This study identified 35 AOCs. In 1986 USATHAMA contracted to have an RI performed; six sites were studied in depth and the US Army Environmental Hygiene Agency (USAEHA) conducted an evaluation of solid waste management units (SWMUs), which considered 72 AOCs. Currently, there are 11 active installation restoration program (IRP) sites that are being remediated or undergoing LTM. The other sites have been classified as needing NFA or have been remediated and are awaiting final closure pending NYSDEC review.

Past solid waste disposal practices have resulted in the contamination of soil, surface water, sediment and groundwater (GW) with landfill leachate containing petroleum hydrocarbons, heavy metals, pesticides, solvents, and paint components. Formerly leaking underground storage tanks (UST) resulted in free-product floating on the water table, contaminating the GW, surface water, sediment and soil. Past explosive ordnance disposal (EOD) activities caused elevated levels of heavy metals and trace explosive and propellant compounds in the soil and GW. Two buildings/sites were contaminated with pesticides.

Petroleum is the predominant contaminant at the remaining 11 active sites. Leaking USTs and piping at nine former fuel dispensing facilities along the area known as Gasoline Alley have resulted in six petroleum contaminated sites (areas 1295, 1395, 1495, 1595, 1795, and 3805) with extensive GW plumes and soil contamination, as well as surface water and sediment contamination at three of the sites. Other active petroleum contaminated sites include Building P-2140 (an active Army and Air Force Exchange Service (AAFES) fueling station with GW, soil, surface water and sediment contamination), Building T1245 (a former fueling facility with soil and GW contamination), and Building T-91 (a maintenance shop with soil and GW contamination). In addition, there are two former landfills: the airfield sanitary landfill with potential metals and phenols impacts to GW and the old sanitary landfill (OSL) with metals, benzene, toluene, ethylbenzene and xylenes (BTEX), phenols, and other contamination of GW, surface water, sediment and soil.

The lead regulatory agency is the NYSDEC Division of Solid and Hazardous Materials. The installation is a large quantity generator.

The Part B permit application has been withdrawn. Permitting requirements pursuant to the Resource Conservation and Recovery Act (RCRA) direct permit holders to evaluate, and if necessary, remediate former SWMUs as a permit condition. After the withdrawal of the RCRA Part B permit, corrective action requirements will be addressed by an order on consent.

Cleanup Exit Strategy

The installation has 11 active sites currently receiving funding. Remedies were in place for all sites by the end of 2007, and all active sites are in the CMI(O) or LTM phases. The status of these sites is as follows:

- FTD-007 OSL: LTM
- FTD-008 Airfield sanitary landfill (ASL): LTM
- FTD-030A area 1295: Monitored natural attenuation (MNA), LTM
- FTD-030B area 1395: MNA, LTM
- FTD-030C area 1495: MNA, LTM

- FTD-030D area 1595: Operate aquifer air sparging (AAS)/soil vapor extraction (SVE)/bioventing systems, limited excavation of the creek if necessary, MNA, LTM

- FTD-030E area 1795: Operate AAS/SVE/bioventing system, MNA, LTM
- FTD-030F area 3805: Operate multi-phase extraction (MPE)/AAS systems at source area, MNA, LTM
- FTD-031 Building T-91: MNA, LTM
- FTD-089 Bldg T-1245 USTs: MNA, LTM
- FTD-091 Bldg P-2140 USTs: Operate dual-phased extraction and AAS systems, MNA, LTM

The Old Sanitary Landfill (OSL) is located along Route 26 across from area 3805 of Gasoline Alley. The landfill covers about 50 acres and was operated from 1940 to 1973. It consists of two cells (which may extend to a depth of 40 feet) divided by a ravine. Debris is believed to have been dumped in low spots of the ravine area. The cells have a synthetic cap, soil, and vegetative cover. Leachate, primarily BTEX, seeps out at points along the lower portions of the side slopes into a stream leading off-post at both landfill cells. The plume reconnaissance performed at Gasoline Alley (FTD-030) indicates that area 3805 is contributing to the contamination found at the landfill. Stream monitoring results show that the contamination is primarily limited to the stream bed adjacent to the cells.

In fiscal year (FY)96 a landfill fence was installed and the vents were upgraded. In FY97 an interim remedial action (IRA) was conducted to remove debris and drums from the site and stabilize slopes. Slope stabilization and erosion control were completed in FY99. The risk assessment was completed in FY00. In FY01, a pilot phytoremediation project was installed and is still ongoing. The GW plume appears stable. Limited cap repairs were completed in FY02 annd FY03. Additional seep sampling was performed in summer FY04.

A corrective measures study (CMS) which included Gasoline Alley area 3805 was completed in FY05 and approved by the NYSDEC in April 2006.

In 2007 a full-scale phytoremediation system was installed on the northern slope of OSL Cell 2 and around the unnamed creek between Cell 1 and Cell 2 to attenuate seep contaminants. In 2007 cap improvements to the OSL Cell 2, including additional fill, new geomembrane, cover, top soil, and establishment of a minimum four percent slope were initiated and were completed in 2008.

This site is included in the FTD PBA contract, which includes annual monitoring, inspection and maintenance of the OSL. All costs through December 2015 are tracked under the PBA. Post-PBA costs for continued monitoring, inspection and maintenance through two five-year reviews in 2018 and 2013 are tracked under this site.

Annual GW and surface water (SW) monitoring will be conducted, with cap and phytoremediation system maintenance and fiveyear reviews.

Site ID: FTD-008 Site Name: AIRFIELD SANITARY LANDFILL

The Airfield Sanitary Landfill (ASL), formerly named Existing Landfill, is located just northeast of Wheeler Sack Army Airfield and covers approximately 37 acres. Reports indicate that paint wastes, pesticide containers, and petroleum, oil, and lubricants (POL) saturated wastes were disposed of here between 1973 and 1987. It was capped in 1988 with a polyvinylchloride cover, soil, and vegetation.

In 1994 monitoring wells required by the NYSDEC were installed and quarterly monitoring was initiated. The four quarter monitoring program completed in 1995 indicated no significant impact to the environment.

A draft closure plan was developed in 1991 which recommended upgrading some of the gas vents, adding cover material, and improving drainage. A revised closure plan for the landfill was submitted in October 1995 and finalized in June 1997. A post closure operations and maintenance plan was finalized in September 1997. Cover improvements were completed in FY99. A trend analysis, finalized in 2001, revealed no significant problems. Cover repairs were completed in FY09.

Site FTD-008 is included in the FTD PBA. Continued monitoring, inspection and maintenance activities through December 2015 are funded under the PBA. Post PBA costs for continued monitoring, inspection and maintenance through two five-year reviews in 2018 and 2023 are tracked under this site.

CLEANUP/EXIT STRATEGY

Landfill cover inspection and maintenance will be conducted annually and GW monitoring will be conducted every five years; well abandonment and site closeout will be completed at a future, undetermined date.

Site ID: FTD-030A Site Name: GASOLINE ALLEY - AREA 1295

Regulatory Driver: RCRA

RRSE: MEDIUM

Contaminants of Concern: Polycyclic Aromatic Hydrocarbons (PAH), Volatiles (VOC)

Media of Concern: Groundwater, Soil

| Phases | Start | End |
|-----------|--------|--------|
| RFA | 198010 | 198107 |

| RIP Date: | 200706 | |
| RC Date: | 201212 | |

Gasoline Alley, located in the cantonment area of FTD, is two miles long, and consisted of diesel, leaded, and unleaded fuel dispensing stations at nine separate areas: 1195, 1295, 1395, 1495, 1595, 1795, 1895, 1995 and 3805. Each area housed several large USTs (each typically 25,000 gallons) and associated piping. The major portion of the contamination is the result of pipes and USTs that leaked.

In 1994, 22 USTs were removed and about 6,000 cubic yards of soil were thermally treated and disposed of off-site. In 1995 all remaining components (pipelines, vaults, valve boxes and dispensing islands) associated with the 22 USTs were removed.

Early RI efforts focused on the 1595 area. A plume reconnaissance was performed which showed free-product at 1395, 1595, 1795, 1895, 1995, and 3805 and dissolved product was found at all areas along Gasoline Alley with the exception of 1195. Soil and GW data indicated that area 1195 had been minimally impacted by kerosene storage and dispensing activities. Low-level petroleum hydrocarbons did not appear to present a threat to GW and NFA is currently planned at area 1195. The study also showed that the plumes at areas 1895, 1995, and 3805 have merged into one major plume that is contributing to the contamination at the OSL (FTD-007). The investigation also showed that the 1795 plume has migrated under the site that is known as the WWII landfill.

Due to the complexity of this site, all related areas were combined as one project for study and planning purposes and to eliminate potential duplication of work. A comprehensive contaminant assessment report (CCAR) connecting these areas together was finalized in FY00.

The phase I risk assessment completed in 2000 indicated that the ecological risk at areas 1595 and 1795 is the primary risk at the site.

In FY02 the site was divided into FTD-030A through F (listed below) to facilitate funding, scheduling, and RA for the six discrete contamination plumes along Gasoline Alley. GW monitoring reports have indicated that the plumes along Gasoline Alley are stable.

- FTD-030 A = area 1295 - FTD-030 B = area 1395
- FTD-030 C = area 1495
- FTD-030 D = area 1595
- FTD-030 E = area 1795 WWII landfill
- FTD-030 F = area 3805

At area 1295 gasoline and diesel fuel leakage has contaminated soil that is acting as a continued source for GW contamination. A pilot system (excavation and oxygen releasing compound [ORC]) was completed in FY00. The ORC was determined to be ineffective.

Site ID: FTD-030A Site Name: GASOLINE ALLEY - AREA 1295

In FY06 a focused technical selection (FTS) study was completed and approved by the NYSDEC. The FTS recommended in situ chemical oxidation and monitored natural attenuation (MNA). Four rounds of in situ chemical oxidation injections were completed in 2006 and 2007 and were determined to be only partially effective. The MNA sampling and additional investigation is currently ongoing.

This site is included in the FTD PBA. All costs for continued MNA, LTM and site closeout are included under the PBA contract. Future LTM is projected to run from October 2009 through April 2012. Site closure is projected for FY12 (revised to FY13).

CLEANUP/EXIT STRATEGY

At completion of in situ treatment of soil and GW, MNA sampling of four monitoring wells followed by semiannual GW closure monitoring will be conducted. The closure report will be completed and well(s) decommissioned.

Site ID: FTD-030B Site Name: GASOLINE ALLEY - AREA 1395

Regulatory Driver: RCRA

RRSE: MEDIUM

Contaminants of Concern: Polycyclic Aromatic Hydrocarbons (PAH), Volatiles (VOC)

Media of Concern: Groundwater, Soil

| Phases | Start | End |
|-----------|--------|--------|
| RFA | 198010 | 198107 |
| CS | 198010 | 198107 |

| RIP Date: | 200109 | |
| RC Date: | 201112 | |

In 1997 bioventing/soil vapor extraction (SVE) systems were installed at area 1395. The SVE systems were never operated. An air sparging system was added in FY00. The remedial system operated until February 2004, at which time it was turned off because contamination levels were below New York State standards. It was restarted in September 2004, due to a rebound in GW contaminant levels, and it operated until August 2006 when the systems were shut down again and MNA was initiated.

Site FTD-030B is included in the FTD PBA contract, which includes all costs for site monitoring and closeout. Future LTM is projected for October 2009 through February 2011. Site closure is projected for FY11 (revised to FY12).

CLEANUP/EXIT STRATEGY

Semiannual MNA sampling will be followed by semiannual closure sampling. Closure expected in FY12 will include a closure report and system decommissioning.

Site ID: FTD-030C Site Name: GASOLINE ALLEY - AREA 1495

Regulatory Driver: RCRA

RRSE: LOW

Contaminants of Concern: Polycyclic Aromatic Hydrocarbons (PAH), Volatiles (VOC)

Media of Concern: Groundwater, Soil

| Phases | Start | End |

| RC Date: | 201112 | |

In 1997 bioventing/SVE systems were installed at area 1495 but were never operated. A pilot air sparging system was added in FY00. The remedial system operated until February 2004, at which time it was turned off because contamination levels were below New York State standards. The GW contaminant levels rebounded above standards however not at high enough levels to warrant restarting the remedial system. The site is currently in MNA.

Site FTD-030C is included in the FTD PBA contract. All costs for continued MNA, LTM, and site closure are included in the PBA. Future phase LTM is projected for October 2009 through February 2011. Site closure is projected for FY11 (revised to FY12).

CLEANUP/EXIT STRATEGY

Semiannual MNA sampling will be followed by semiannual GW closure monitoring of four wells. Closure, expected in 2012, will include closure report and system decommissioning.

Site ID: FTD-030D Site Name: GASOLINE ALLEY - AREA 1595

SITE DESCRIPTION

In 1975, a hole was discovered in a large UST used to fuel Army vehicles at area 1595. The tank was subsequently replaced. Contamination was discovered in a small pond and stream downgradient reaching about 300 feet downstream.

A preliminary assessment was performed and an auto-skimmer was installed at the pond in 1990 and operated until 1994. A site inspection (SI) found free-product in wells. A free-product recovery and contaminated water treatment facility was installed in February 1992. Upgrades to the treatment facility were completed in FY95 and FY97. During FY97, contaminated soil was excavated from the pond and two weirs were constructed for flow measurements.

In FY99 additional recovery wells were installed, subsurface lines were replaced, and the treatment system was enhanced.

In FY00 the pump-and-treat system was upgraded (air stripper), a system evaluation was completed, and the GW model was updated. A chemical oxidation pilot study in FY02 indicated that this technology would not be effective.

In 2004 a decision document (DD) was signed.

In April 2004 the final CMS was submitted and approved by the NYS-DEC. An SVE/AAS was designed and constructed in FY05 to replace the pump-and-treat system, and is currently operational.

This site is included in the FTD PBA contract. All costs through FY2015 are tracked under the site PBA@FortDrum. Post-PBA residual costs for continued MNA and site closure are tracked under FTD-30D.

CLEANUP/EXIT STRATEGY

The SVE/AAS systems will be ramped down and MNA achieved by FY14. Biennial sampling of GW (eight wells) will continue through 2020 and MNA, or, if required, excavation will be conducted for the creek sediment. Closure is expected in 2020, including well abandonment, system decommissioning, and site closeout documentation.

Site ID: FTD-030E Site Name: GASOLINE ALLEY - AREA 1795/WWII LANDFILL

Regulatory Driver: RCRA

Area 1795 was a fuel dispensing area that released POL contamination. In addition, the WWII Landfill [formerly FTD-078, environmental program requirements (EPR) FTDR-029] is a surface dump within area 1795. The landfill, which was discovered in 1989, is approximately 6.5 acres and is heavily wooded. Debris is visible on the surface. The plume reconnaissance performed on Gasoline Alley in 1994 linked the two sites together. Sampling of debris indicated limited polychlorinated biphenyl (PCB) contamination.

At area 1795, a pump-and-treat pilot system was operated from FY96 to FY98 for GW depression and separate phase product recovery. This system was discontinued due to limited thickness of the free-product layer. A pilot AAS was tested in FY98 and indicated that this technology would be appropriate as part of a final remedy. A pilot bioslurping system (free-product recovery enhancement) was operated from FY98 to FY00. This system was discontinued due to the high water table.

A final CMS, submitted and approved in June 2004, recommended SVE/AAS treatment systems and limited excavation of the WWII landfill. The design was funded in FY05 and construction of the remedial system was funded in FY06.

Construction of the SVE/AAS systems was completed in 2007 and the systems are currently operational.

This site is included in the FTD PBA contract. All costs through FY15 are tracked under the site PBA at FortDrum. Post-PBA residual costs for continued MNA and site closure are tracked under FTD-30E.

CLEANUP/EXIT STRATEGY

The SVE/AAS systems will be ramped down. Annual MNA sampling will continue through FY11, followed by biennial GW sampling through FY20. Site closure is expected in 2020, including well abandonment, system decommissioning and site closeout documentation.

Site ID: FTD-030F Site Name: GASOLINE ALLEY - AREA 3805

Regulatory Driver: RCRA

RRSE: HIGH

| CMI(C) | 200209 | 200709 |
| CMI(O) | 200410 | 201509 |
| LTM | 201510 | 202509 |
| RIP Date: | 200709 | |
| RC Date: | 201509 | |

Area 3805 includes three former fuel storage and dispensing areas (1895, 1995, 3805) whose plumes have commingled. Impacted soil is approximately 850,000 cubic feet. The free-product plume is approximately 450,000 square feet. The dissolved plume extends approximately 1,100 feet and exceeds 400 feet in width. The plume extends under OSL (FTD-007) prior to discharge to the OSL creek. Since 1995, approx. 30,000 gallons of free-product have been removed. An updated GW model was completed in September 2000.

A combined CMS for area 3805 and OSL was funded in FY00 and an FTS for the source area was completed in 2001. A multiphase extraction (MPE) system was recommended for the source area. The RD for the source area was completed in 2002 and construction of an MPE and an AAS system was completed in FY04.

In FY05 a combined CMS for areas 3805/OSL was completed and was approved by the NYSDEC in April 2006. A supplemental sparging line was completed in 2007 and is currently operational.

This site is included in the FTD PBA contract. All costs through FY2015 are tracked under the site PBA at FTD. Post-PBA residual costs for continued MNA and site closure are tracked under FTD-30F.

CLEANUP/EXIT STRATEGY

Operation of the MPE and AAS systems will continue at the source area. Sampling will be reduced after five years of MPE/AAS operation. Sampling will continue to FY21. The MPE is expected to go off-line in FY11 and AAS systems are expected to operate through FY15. Biennial LTM sampling will be conducted from FY16 through FY25. Site closeout, expected in FY25, will include well abandonment, system decommissioning, and site closure documentation.

Site ID: FTD-031 Site Name: BUILDING T-91

Regulatory Driver: RCRA

RRSE: MEDIUM

Contaminants of Concern: Petroleum, Oil and Lubricants (POL)

Media of Concern: Groundwater, Soil

| Phases | Start | End |
|-----------|--------|--------|
| RFA | 198010 | 198107 |
| CS | 198010 | 198107 |
| RFI/CMS | 199003 | 199412 |
| CMI(C) | 199412 | 200609 |
| CMI(O) | 199412 | 201112 |
| RIP Date: | 200609 | |
| RC Date: | 201112 | |

Building T-91 was previously used as a vehicle maintenance facility and is located at the intersection of First Street West and Warehouse Road. It is currently being used as a wheeled vehicle maintenance shop. The facility discharged solvent and petroleum contaminated wastewater directly onto the ground via a drain pipe. There were several USTs and aboveground storage tanks around the building. Free petroleum product was discovered in a monitoring well installed during a 1990 SI. The SI and follow-on fieldwork were completed during FY94. The wells have been periodically monitored, and free-product has not been observed at the site since the initial investigation. Limited dissolved phase fuel constituents remain above New York State GW standards. Based on a 2006 sampling event, GW contamination remains above standards and MNA sampling will continue.

Building T-91 is included in the PBA contract for FTD. All activities through site closeout are included under the PBA. Site closure is projected for FY11 (revised to FY12).

CLEANUP/EXIT STRATEGY

MNA sampling will continue every two years per NYSDEC, followed by closure (including a closure report and well decommissioning), which is expected in FY12.

Site ID: FTD-089 Site Name: BLDG 1245 UST

Regulatory Driver: RCRA

RRSE: MEDIUM

Contaminants of Concern: Petroleum, Oil and Lubricants (POL)

Media of Concern: Groundwater, Soil

| Phases | Start | End |
|-----------|--------|--------|
| RFA | 199207 | 199408 |

| RFI/CMS | 199310 | 200505 |
| IRA | 199506 | 199905 |
| CMI(C) | 199905 | 200505 |
| CMI(O) | 200505 | 201112 |
| RIP Date: | 200505 | |
| RC Date: | 201112 | |

This project was initiated upon the discovery of extensive contamination from leaking USTs in the vicinity of former building T1245. Pools of petroleum product were observed in the excavations of one diesel tank and one motor gasoline (MOGAS) tank. These leaking tanks were removed in September 1992. The area is still used as a maintenance facility.

An SI was completed in 1994, showing GW and soil contamination exceeding NYSDEC standards. An IRA/pilot study of air sparging/bioventing Unterdruck-Verdampfer-Brunnen (UVB) to treat GW and soil began in 1995. The 1999 pilot study report determined that the UVB technology was not effective, based on a 1998 tracer study. The RI report was completed in April 2001, confirming the extent of the soil contamination (about 1,350 cubic yards) and a GW plume (about one acre). Natural degradation of GW contamination appears to be occurring.

An FTS completed in FY05 recommended MNA. MNA sampling is ongoing.

Site FTD-089 is included in the FTD PBA contract, which covers costs for all activities through site closeout. Site closure is projected for FY11(revised to FY12).

The MNA with biennial sampling will continue. Closure, including closure report and well decommissioning, is expected in FY12.

Site ID: FTD-091 Site Name: BLDG P-2140 USTS

Regulatory Driver: RCRA RRSE: HIGH Contaminants of Concern: Volatiles (VOC) Media of Concern: Groundwater, Soil, Surface Water

| Phases | Start | End |

| CMI(O) | 200201 | 201406 |
| RIP Date: | 200201 | |
| RC Date: | 201406 | |

Building P-2140 is an active AAFES gas station. In 1993 five fuel storage USTs were removed and three USTs were installed as replacements in a different area of the site. Contamination from prior activities was observed during excavation.

An SI completed in 1994 showed the dissolved portion of the plume migrating toward the Installation boundary. An RA for freeproduct recovery and GW treatment was initiated in FY95. Approximately 1,400 gallons of free-product have been recovered. This system has since been replaced by a dual-phased extraction (DPE) system in the source area.

In FY99 and FY00 the plume was further delineated and additional wells were installed. An air sparge (with ozone) pilot system was installed in January 2001. Sampling at the boundary detected BTEX and methyl tertiary-butyl ether (MTBE) contamination. Currently, two air sparging lines are installed in downgradient sections of the plume to address dissolved phase contamination. The system is operating effectively.

In January 2002 the full scale DPE pilot was installed to address separate phase contamination in the source area. In FY05 an AAS was added in the source area to augment the DPE. The DPE and AAS systems are currently operational. The downgradient AAS with ozone system was shut down in March 2009 with concurrence of NYSDEC.

The CMS was completed and approved by the NYSDEC April 2004.

Site FTD-091 is included in the PBA contract for FTD. All activities through site close-out, projected for FY11 (revised to FY14), are included in the PBA.

CLEANUP/EXIT STRATEGY

Operation and maintenance of the air sparge system and DPE will ramp-down. Closure, expected in FY14, will include a closure report as well as abandonment of the system and 80 wells.

Site ID: PBA@FortDrum Site Name: PBA at Fort Drum

Regulatory Driver: RCRA

RRSE: LOW

Contaminants of Concern: Metals, Petroleum, Oil and Lubricants (POL), Polycyclic Aromatic Hydrocarbons (PAH), Volatiles (VOC)

Media of Concern: Groundwater, Sediment, Soil, Surface Water

SITE DESCRIPTION

This PBA site was created to track funding for the PBA awarded in FY08. The following sites are under this PBA: - FTD-007,

- FTD-008,
- FTD-030A,
- FTD-030B,
- FTD-030C,
- FTD-030D,
- FTD-030E,
- FTD-030F,
- FTD-031,
- FTD-089, and
- FTD-091.

Please refer to the individual site descriptions.

CLEANUP/EXIT STRATEGY

See individual sites for cleanup/exit strategies.

Contamination Assessment Overview

Environmental restoration activities include the IRP and Military Munitions Response Program (MMRP). On Dec. 29, 2008, the Office of the Deputy Under Secretary of Defense for Installations and Environment [ODUSD(I&E)] issued an interim policy for Defense Environmental Restoration Program (DERP) eligibility that rescinded the 1986 eligibility date for the IRP and the 2002 eligibility date for the MMRP. This made many sites previously addressed in the Army's Compliance-related Cleanup (CC) program eligible for the DERP. Sites that are now eligible for the MMRP have been migrated from Army Environmental Database - Compliance-related Cleanup (AEDB-CC) and given the naming convention of other munitions response (MR) sites. The newly eligible non-MR type sites are considered to be installation restoration (IR) sites; however, the newly eligible sites are being coded as compliance restoration (CR) in AEDB-R to distinguish them from the original IR sites and IR metrics.

In 2009 a total of 11 UST sites with POL contamination were migrated from the CC program to the CR program. Of these 11 sites, 10 were determined by NYSDEC to require NFA in late-2009. One of these UST sites (CCFD10470W) is being actively remediated in-house by FTD, Environmental using vacuum pumping.

In 2010 a new site (CCFD-030G) was added to the CR program when it was determined that solvent tetrachloroethylene (PCE) contamination, previously identified in conjunction with monitoring at the FTD-030F site, was significant and likely had a different source than the contamination at FTD-030F. This site is currently in the RI phase in order to determine the nature and extent of the PCE contamination. In late 2010 a new site (CCFD-030H) with POL contamination was identified while installing light poles and was added to the CR program. An RI and limited FS are planned with a presumed remedy of soil excavation.

Cleanup Exit Strategy

Site CCFD-10470W has been remediated and a request for approval of NFA has been submitted to NYSDEC. Site CCFD-030G is currently in RI to determine the nature and extent of contamination. Following the RI, an FS will be completed to determine appropriate RAs. An RI/FS is expected to be initiated at new site (CCFD-030H) in FY11 and the presumed remedy is soil excavation.

| RC Date: | 201307 | |

Fort Drum Military reservation is located in upstate New York approximately 10 miles northeast of Watertown, 80 miles north of Syracuse, and 25 miles southeast of the US/ Canadian border. The installation occupies a large portion of northeastern Jefferson County and a portion of western Lewis County. The reservation encompasses approximately 168 square miles.

The installation was established in 1906 as a National Guard training facility. During WWII, the reservation functioned as an operations base and firing range and provided combat skills training facilities for the 45th Infantry Division and the 4th and 5th Armored Divisions. Additionally, the reservation conducted small amounts of EOD. Currently, FTD is the operations headquarters for the 10th Mountain Division(Light Infantry). The reservation also supports training facilities and services for the US Army National Guard.

Gasoline Alley is located on the eastern side of FTD in the developed portion of the reservation known as the old cantonment area. The two-mile-long thoroughfare consists of two parallel one-way streets, Oneida and Ontario Avenues, and an associated unpaved median located between the two avenues. Gasoline Alley is used as one of the main traffic flow paths in the reservation. Vehicle and equipment storage and maintenance areas are located to the south of Gasoline Alley, and a rail line and coal-fired power generation plant are located to the north.

Gasoline Alley has been used for fuel storage and dispensing at least since the 1940s when FTD was expanded. Nine fuel dispensing areas were located along Gasoline Alley where kerosene, gasoline, diesel fuel and jet propellant (JP)-4 were stored and dispensed from 22 USTs ranging in capacity size from 5,000 to 25,000 gallons. The dispensing areas are referred to as areas 1195, 1295, 1395, 1495, 1595, 1795, 1895, 1995, and 3805. The USTs, fuel dispensers, and associated piping were removed in 1994 and 1995.

There has been documented storage and use of hazardous materials, including solvents, both upgradient and crossgradient of areas 1800/1900/3800. An investigation of historical GW chemistry data associated with a BTEX plume in the 1900/3800 areas (site FTD-030F) has indicated the presence of dissolved-phase chlorinated solvents (specifically PCE) in the aquifer below the 3800 area and below the existing BTEX plume. The findings of the investigation also point to several potential upgradient sources of solvents associated with historical use and poor handling practices at buildings in the 1800/1900/3800 areas. In 2009, because the solvent contamination source is likely upgradient of the BTEX plume source and vertically separated from the BTEX plume and will require different remedial technologies, a new IRP site was established and in FY10 a site investigation to determine the nature and extent of the contamination was initiated and is ongoing.

The identified contaminant of concern is PCE; however, related solvents and relevant breakdown products may be present. It is suspected that releases from the site have contaminated soils and GW beneath the site and migrated northwesterly within FTD property. In addition, PCE contamination has been found at depth in the vicinity of the FTD-030F petroleum plume and the FTD-007 OSL.

An RI funded in FY10 will determine the nature and extent of PCE contamination.

Site ID: CCFD-030G Site Name: Gasoline Alley - 1800, 1900 & 3800

The cleanup/exit strategy is to be determined in FS which will follow-ongoing RI of the nature and extent of contamination.

Site ID: CCFD-030H Site Name: Gasoline Alley Area 1700

Regulatory Driver: CERCLA Contaminants of Concern: Petroleum, Oil and Lubricants (POL)

Media of Concern: Groundwater, Soil

RC Date: 201312

Gasoline Alley is located in the developed cantonment area on the southwest corner of FTD. The two-mile long thoroughfare consists of two parallel one-way streets, Oneida and Ontario Avenues, and an associated unpaved median, and is used as one of the main traffic routes. Vehicle and equipment storage and maintenance areas are located on the south side of Ontario Ave., and a rail line and power plant are located on the north side of Oneida Ave. Gasoline Alley has been used for fuel storage and dispensing at least since the 1940s. Nine fuel dispensing areas were located along Gasoline Alley where kerosene, gasoline, diesel fuel, and jet propellant (JP-4) were stored and dispensed from 22 USTs ranging in size from 5,000 to 25,000 gallons. The dispensing areas are referred to as areas 1195, 1295, 1395, 1495, 1595, 1795, 1895, 1995, and 3805. The USTs, fuel dispensers, and associated piping were removed in 1994 and 1995.

The CCFD-030H site is located in Area 1700 south of Ontario Ave. and west of Seventh St. West. The Pine Plains delta and surficial aquifer cover the southern one-third of FTD, and fine- to medium-grained sands of the Pine Plains Delta to depths of greater than 45 ft. are present in Gasoline Alley Area 1700. Although there is a groundwater divide south of the site and a secondary divide just east of the site, groundwater movement is thought to be northwest toward the Area 1795 Creek which is immediately west of the site and flows northwest to Remington Pond.

On Sept. 2, 2010, while installing light poles for security lighting at the 99th RRC USAR equipment storage site, contamination was discovered at approximately six to eight feet below grade beneath an apparent fabric material. Test pits were installed in all four directions, approximately 15 ft from the initial pole installation point, and contamination was present in the soil and groundwater at several of these locations. Subsequent analytical results indicated "lube oil" contamination of 8700 mg/kg in the soil and 81 mg/l in the groundwater. The new site is upgradient of the existing FTD-030E Gasoline Alley Area 1795 site and upgradient of the presumed source of the Area 1795 contamination, USTs and piping associated with fuel dispensers along Gasoline Alley. This site has been assigned Spill # 1006064 by NYSDEC.

An RI/FS and IRA excavation are planned.

Site ID: CCFD10470W Site Name: P-10470 West

Regulatory Driver: RCRA Contaminants of Concern: Petroleum, Oil and Lubricants (POL)

Media of Concern: Groundwater, Soil

| Phases | Start | End |

| ISC | 200607 | 200608 |
| INV | 200607 | 201106 |
| IRA | 200906 | 201106 |
| RIP Date: | N/A | |
| RC Date: | 201106 | |

Maintenance facility (P-10470) built in late-1980s is located on 5th Armored Division Drive.

In April 2006 a spill was discovered at Building P-10570. Oil was discovered in the interstitial space of the used oil UST. Further investigation revealed incompatible piping as the cause of the leak. Thirty-six other USTs had the same incompatible piping systems. Action to remove all 37 USTs at the 30 sites was taken through a Compliance Deficiency Resolution request. The removals were accomplished at all 30 sites in the 4th quarter of FY2006. Of the 30 sites, 23 have been determined to require further investigation.

As part of an initial site investigation, TDK Engineering Associates removed a UST and associated piping, collected samples from six soil borings, and installed and sampled three GW monitoring wells.

Preliminary results from four investigations indicated further monitoring and/or installation of monitoring wells was required. A monitoring well was installed in the tank excavation area. Four weekly vacuum events were conducted to remove product. A round of GW sampling was completed. Based on the results, it was determined that additional vacuum events and monitoring were required. In FY10 weekly vacuum events and sampling every six months were performed by FTD Environmental and remediation is considered complete pending NYSDEC approval of NFA. An NFA determination from NYSDEC has been petitioned. The monitoring wells will be abandoned when NFA is approved by NYSDEC.

The IRA includes weekly vacuum pumping of recovery well and sampling every six months. This approach has resulted in closure of similar CR sites.

Community Involvement

Technical Review Committee (TRC): None

Community Involvement Plan (Date Published): 200604

Restoration Advisory Board (RAB): No

Reason Not Established: The community has expressed no sufficient, sustained interest in a RAB.

Community Interest Solicited on: 200601

Efforts Taken to Determine Interest

The US Army has developed a community involvement plan for the FTD IRP (2006) to facilitate local community involvement in accordance with USEPA guidance, including the Superfund Community Involvement Handbook (USEPA 2002) and the RCRA Public Participation Manual (USEPA 1996). Interviews with local elected officials, agency personnel, and local residents were conducted to determine interest in establishing a RAB.

Results

A determination was made that a RAB was not needed at this time due to lack of community interest.

Follow-up Procedures

The community relations plan recommended continued surveys of community interest in forming a RAB as long as there were sites without remedies-in-place. Two new CR sites that do not have remedies-in-place were recently added to the program. In 2011, when information about the nature and extent of contamination of these sites under investigation is available, FTD will again monitor the public's interest in forming a RAB.

Additional Community Involvement Information

The Community Relations Plan is scheduled for update in 2011.
