1 INTRODUCTION

FPM Remediations, Inc. (FPM), in association with CAPE Environmental, Inc. (CAPE) under contract with the Air Force Center for Engineering and the Environment (AFCEE), is conducting a groundwater monitoring program at Spill Site (SS) 060 [Building 35 Area of Concern (AOC)] at the former Griffiss Air Force Base (AFB), New York (Figure 1-1). The Building 35 AOC is illustrated in Figure 1-2. The monitoring program at the site is conducted in accordance with provisions of the Basic Contract # FA8903-10-D-8595 and Delivery Order # 0014.

This annual report has been prepared to provide the groundwater monitoring data from June 2011 and to discuss the July 2011 groundwater remediation activities. Groundwater sampling and remediation was conducted in accordance with the SS060 (Building 35 AOC) Optimization Plan (FPM/CAPE, July 2011).

2 SS060 (BUILDING 35 AOC)

2.1 SITE LOCATION AND HISTORY

Building 35 was located in the southeast-central section of the base (Figure 1-2), near an area that was used for outside storage of drums and scrap material during the 1940s. An unknown quantity of drums and transformers were also stored in this area during the late 1960s and 1970s. Site closure was a requirement under the Building 35 Resource Conservation and Recovery Act (RCRA) Hazardous Waste Storage permit and the closure activities were performed in the late 1990s (OHM Remediation Services Corporation [OHM], July 1997).

The former Hazardous Waste Storage Area (HWSA) was located in the southwest corner of Building 35 and had dimensions of approximately 30 feet (ft) by 50 ft or 1,500 square feet. Although a hazardous waste inventory is not available for the area, the area was assumed to contain waste associated with aircraft maintenance activities such as corrosion control painting, degreasing, and routine engine, wheel and tire services. There is no record of any spills at the HWSA.

The former polychlorinated biphenyl (PCB) storage area was located in the northwest corner of Building 35 and had approximate dimensions of 37 ft by 46 ft (1,702 square ft). Inspection reports indicate that PCB items were stored in the area since at least 1985. A spill in the PCB area was recorded on October 25, 1991, when approximately one quart of transformer oil leaked from a damaged terminal to part of a wooden pallet and a 2-inch diameter area on the concrete floor. The oil was tested and was reported below 5 parts per million (ppm) PCBs. Base records also indicate that a small PCB spill occurred on March 16, 1995. This spill reportedly occurred when a PCB-containing transformer was moved from the containment area within Building 35. The spill area, approximately 20 square ft in area, was properly remediated.

2.2 HYDROGEOLOGICAL SETTING

The Building 35 complex covered an approximate 1 acre area and is now utilized as a parking lot for Birnie Bus Service, Inc. The site has a topographic relief of 3 to 4 ft. The soils are predominantly composed of silty, fine to coarse sands with gravel. Surface water drainage from the site enters a shallow drainage swale, which leads southerly to a culvert drainage ditch informally referred to as Rainbow Creek, and ultimately flows east to Six Mile Creek.

During the Building 35 RCRA closure activities, groundwater elevations were recorded in May and July 1998. The depth to groundwater was approximately 6.9 to 7.2 ft below ground surface (bgs) [approximately 456.4 – 456.1 ft mean sea level (MSL)]. Groundwater contours interpreted from ground water elevation data collected show the groundwater flow direction to be northeast in 1998 (OHM, April 2000). This groundwater flow direction was confirmed during the subsequent March 2002, March 2003, and June 2004 sampling rounds.

It was noted in the reports from the April 2010 sampling event that monitoring well B035MW-4 water level measurement could not be obtained due to riser deformation. The well riser was hit by a snowplow during the winter season, which bent the riser. The riser was excavated and the

well head was reconstructed as a flush mount. The three remaining wells at the site were also reconstructed as flush mounts when the parking lot was paved for use as a bus storage lot for the building tenant, Birnie Bus Services. All monitoring wells (B035MW-1, -2, -3, -4) at the site were resurveyed on July 13, 2010, and depth to groundwater was also measured on this date. The groundwater flow changed from previous sampling events where the hydraulic gradient is minimal with a general southerly flow. Monitoring well B035MW-4 is exhibiting recharge from two adjacent 48-inch storm drains. Therefore the hydraulic grade at this point is the highest. Also, the other wells are in a paved parking lot allowing for minimum infiltration from surface water runoff. The depths to groundwater were measured on August 26, 2011 at monitoring wells B035MW-1, -2, -3, and -4. The mean depth was 6.2 ft bgs. Groundwater elevations for each well and the interpreted potentiometric surface map are provided in Figure 2-1.

2.3 SUMMARY OF PREVIOUS INVESTIGATIONS

Closure activities for the HWSA and PCB areas in association with RCRA New York State Department of Environmental Conservation (NYSDEC) Permit #6-3-13-00063/00020-0 were conducted by OHM in 1996 in accordance with Closure Plans approved by the NYSDEC in 1995. The Closure Plans were designed to ensure that the Building 35 storage areas would require no further maintenance after clean closure, and threats to human health and the environment would be minimized or eliminated. The closure activities included the collection of pre-closure wipe samples from each storage area and surface soil samples (0 to 1 ft bgs) from the outside perimeter of the building. Twelve surface soil samples were analyzed for PCBs, and all twelve samples indicated elevated concentrations of PCBs above the recommended action level of 1 ppm (OHM, July 1997).

An extensive soil investigation was conducted from January to March 1997 to delineate the extent of contaminated soil in the vicinity of Building 35 that were above the cleanup levels, which were established at 1 ppm in surface soil and 10 ppm in subsurface soil to meet United States Environmental Protection Agency (USEPA) and NYSDEC guidelines. A total of 140 Geoprobe® borings were installed in both the surface and subsurface soils surrounding Building 35, including three borings advanced underneath the building floor. Soil samples were analyzed for total PCBs in the field using a gas chromatograph with an electron capture detector. In addition, eight groundwater samples were collected during the Geoprobe® activities, and were analyzed for total PCBs, Volatile Organic Compounds (VOCs), Semi-Volatile Organic Compounds (SVOCs), pesticides, and metals (OHM, July 1997).

Results indicated widespread PCB contamination throughout the subsurface soils and also indicated possible groundwater contamination. Soil detections for PCBs ranged from non-detectable levels to 3,079 ppm. Several hot spots were identified during the investigation, with PCB concentrations recorded above regulatory action levels at a depth interval of 6 to 7 ft bgs. No correlation was found between PCB concentration and sample depth nor between PCB concentration and distance from the building, indicating that the contamination may have been due to numerous sources, or the result of using imported fill at the site which potentially contained PCBs (OHM, July 1997).

Of the eight groundwater samples collected, seven indicated PCB concentrations above the PCB action level (0.1 micrograms per liter [µg/L]). The highest total PCB concentration (210 µg/L) was reported from sample B035-GW05, located near the southeast corner of Building 35. No VOCs or SVOCs were detected above regulatory action levels. Two pesticides, dieldrin and endrin, and several metals were detected at concentrations above action levels. Two chlorinated VOCs, total 1,2-dichloroethylene (DCE) at 5 µg/L, and vinyl chloride at 1 µg/L, were also reported above detection limits at B035-GW07. Results indicated that previous waste storage activities had potentially impacted the local groundwater conditions, but were inconclusive as the Geoprobe® samples collected were characterized with high suspended solids content, which is associated with higher concentrations of pesticides and metals due to the adsorption of these contaminants to fine particulates (OHM, July 1997).

An Interim Remedial Action was conducted in 1997 at the adjacent Defense Reutilization Marketing Office (DRMO) Area. The interim remedial action was performed to excavate, transport, and dispose of PCB-contaminated soil and debris, and backfill the area with clean soil. Building 35 was also demolished during this action. Following excavation at the DRMO Area, 82 confirmatory samples were collected using a sampling grid system comprised of 82 grid cells. Twenty seven (27) of the 68 grids had PCB exceedances. Three additional rounds of soil excavation occurred; where in total 130 confirmatory samples were collected. Confirmatory samples were compared to state recommended cleanup levels, where values were taken from the NYSDEC Technical and Administrative Guidance Memorandum 4046. All values are reported in Table 3.1-2 DRMO Area Confirmatory Sample Results Summary of Positive Hits and Validation Qualifiers, Appendix E of the Closeout Report Interim Remedial Action DRMO Area (IT, May 1999). Approximately 24,414 tons of PCB-contaminated soil/concrete were removed from the DRMO Area during the IRA. An estimated 20,078 tons were disposed of off-site as non-hazardous soil/concrete, and 4,336 tons as hazardous soil.

In Spring 1998, OHM installed four groundwater monitoring wells within the Building 35 area to characterize groundwater conditions and to determine the local groundwater flow direction. B035MW-4 is located near the intersection of two storm drains within the site boundaries – two 48-inch storm drains running from the northwest to the southeast near the northeast corner of the former Building 35 footprint and one 30-inch drain running perpendicular from the southwest to the two 48-inch drains – to assess any impacts the storm drains might have on groundwater flow. B035MW-3 is located near the highest concentration of PCBs detected in the soil samples, which was the same location with the highest PCB concentration in groundwater samples collected with the Geoprobe®. B035MW-1 and -2 are located north and southwest of Building 35, respectively. The total depth of each well is approximately 14 ft bgs. These wells are the current wells that have been monitored throughout site long term monitoring activities.

Two groundwater monitoring rounds were conducted in May and July 1998, when samples were submitted for PCBs, VOCs, SVOCs, pesticides, and metals analyses. Results indicated two VOCs – vinyl chloride (VC) and total 1,2-DCE (including both the cis and trans isomers) – at levels above NYS Class GA Groundwater Standards in B035MW-4; total 1,2-DCE only was reported above the NYS Class GA Groundwater Standard in B035MW-3 (8 µg/L). Concentrations were reported up to 6 µg/L and 42 µg/L for vinyl chloride and 1,2-DCE, respectively, both in B035MW-4. No PCBs were reported above the detection limit during

either sampling round (1 µg/L [2 µg/L for arochlor 1221] for May 1998 and 0.06 µg/L for July 1998) (OHM, April 2000).

In addition, during the two groundwater sampling rounds, several metals were reported at levels above NYS Class GA Groundwater Standards, including iron, manganese, sodium, lead, antimony, copper, zinc, chromium, arsenic, and thallium. Samples were collected using a disposable bailer and were submitted as unfiltered groundwater samples for total metals analysis.

In accordance with the closure requirements under the RCRA Permit for Building 35, threats to human health and the environment have been minimized or eliminated (i.e., source areas have been removed). In addition, Land Use Control/Institutional Controls (LUC/ICs) were implemented at the site (OHM, April 2000). Closure under the RCRA Permit was approved by the NYSDEC in a letter dated December 8, 1999. The LUC/ICs are inspected annually and reported in a separate report. Additionally, groundwater monitoring was implemented at the site in 2002 as part of the On-Base Groundwater AOCs.

2.4 LONG TERM MONITORING (2002 TO 2010)

FPM performed Long Term Monitoring (LTM) in March 2002, March 2003, June 2004, March 2005, March 2006, April 2007, April 2008, March 2009, and April 2010. From March 2002 to June 2004, the groundwater at the Building 35 site was monitored for VOCs (SW8260 AFCEE QAPP 3.1 List), SVOCs (SW8270 AFCEE QAPP 3.1 List), and total and dissolved metals (SW6010 AFCEE QAPP 3.1 List plus lead and mercury) at monitoring wells B035MW-1, -2, -3, and -4. VOC concentrations were detected above NYS Class GA Groundwater Standards at only B035MW-4. No SVOCs were detected. Total metals analysis was performed on groundwater that contained suspended solids and dissolved metals analyses were performed on the groundwater after filtration removed the suspended solids. SVOC and metals analysis were discontinued after June 2004.

The recommendations in the Revised On-Base Groundwater Report (FPM, November 2004) were implemented during the March 2005 sampling round, and included only one well (B035MW-04) which was sampled for VOCs only. The VOC results indicated two exceedances as opposed to past sampling rounds which indicated one exceedance. The two exceedances included cis-1,2-DCE and vinyl chloride (VC). The cis-1,2-DCE concentrations ranged from 7.8 µg/L to 32 µg/L and the VC concentrations ranged from 0.54 µg/L to 3.03 µg/L. The NYS Class GA Groundwater Standard for cis-1,2-DCE and VC are 5 µg/L and 2 µg/L, respectively.

2.5 GROUNDWATER REMEDIATION (2005, 2006, 2008, AND 2011)

Based on LTM sampling results, direct injection of remedial compounds was performed at the site in efforts to remediate COCs. The purpose of the direct injection activities is to degrade and remediate the chlorinated hydrocarbon plume at the site. The following describes the four injections conducted at the site.

Injection 1: Hydrogen Release Compound (HRC®) releases lactic acid for fermentation by microorganisms producing hydrogen as an electron donor. Hydrogen then degrades chlorinated

hydrocarbons. HRC® was injected in December 2005 at the Building 35 AOC in a 50-ft wall with five injection points. HRC® was injected from 20 to 10 ft bgs at a rate of eight pounds of product per foot at each of the injection points.

Injection 2: HRC® was injected in August 2006 at the Building 35 AOC in two 50-ft walls with five injection points. HRC® was injected from 20 to 10 ft bgs at a rate of eight pounds of product per foot.

Injection 3: Newman Zone® releases emulsified vegetable oil for fermentation by microorganisms producing hydrogen as an electron donor. Hydrogen then degrades chlorinated hydrocarbons. Newman Zone® was injected at two percent solution in December 2008 in monitoring well B035MW-4 at the Building 35 AOC. 1,000 pounds of product was injected.

The first three injections were recommended in the LTM reports, including August 2005 Groundwater Monitoring Report (FPM, August 2005) for the December 2005 injection, August 2006 Groundwater Monitoring Report (FPM, August 2006) for the August 2006 injection, and May 2008 Groundwater Monitoring Report (FPM, May 2008) for the December 2008 injection. The injection activities were summarized in the On-base Groundwater AOCs Monitoring Report (August 2006), (August 2007), and (August 2009), respectively.

Injection 4: 640 pounds of Newman Zone® was injected at the Building 35 AOC on July 6 and 7, 2011 in accordance with the Draft-Final SS060 (Building 35 AOC) Optimization Plan (FPM/CAPE, July 2011). Newman Zone® solution (two percent solution) was injected at four injection points positioned in a 15-foot arc southwest of B035MW-4. The injection points are illustrated on Figure 2-1. For the 2011 injection event the Newman Zone® solution consisted of 16 gallons of Newman Zone® to 984 gallons of water. At each injection point, Newman Zone® solution was injected in 1-foot intervals from 16 to 8 ft bgs. The photos and field book notes from this event are provided in Appendix A. The injection points utilized for this injection event were registered with the USEPA Underground Injection Control Program (UICP). This documentation is also provided in Appendix A.

2.6 GROUNDWATER MONITORING (2011)

Groundwater samples were collected from B035MW-4 and analyzed for the VOCs as identified during previous investigations in June 2011. Both existing data and the information from new sampling are utilized for overall performance evaluation. Sample collection and analysis was conducted in accordance with the Draft-Final Uniform Federal Policy Quality Assurance Project Plan (QAPP), Revision 1.0 (FPM, July 2011).

Daily Chemical Quality Control Reports (CQCRs) completed during the June 2011 sampling round are provided in Appendix B. The complete list of analytes and the validated laboratory data are attached in Appendix C and the raw laboratory data are available in Appendix D. The analytical results for compounds detected in the groundwater at the Building 35 AOC are shown in Table 2-1.

June 2011:

Monitoring well B035MW-4 was the only well sampled during the June 2011 sampling round. Analyses were performed for VOCs and alkalinity, chloride, nitrate, sulfate, and total organic carbon (TOC) to evaluate groundwater chemistry. Groundwater depth measurements were also collected at the four site monitoring wells (B035MW-1, -2, -3, and -4). The measurements showed that the groundwater was flowing to the northeast.

Analytical results indicated that cis-1,2-DCE (15 µg/L) and VC (4.3 µg/L) exceeded regulatory levels. The NYSDEC Class GA Groundwater Standards for cis-1,2-DCE and VC are 5 µg/L and 2 µg/L, respectively. Trichloroethene (TCE) and trans-1,2-DCE were below their respective NYSDEC Class GA Groundwater Standards of 5 µg/L. This sampling round is the first time Perchloroethene (PCE) was not detected.

Groundwater chemistry results indicated an increase in chloride concentration from 96 milligrams per liter (mg/L) in April 2010 to 230 mg/L in June 2011, sulfate also increased from 11 mg/L in April 2010 to 14 mg/L in June 2011, and TOC decreased from 1.9 mg/L in April 2010 to 1.5 mg/L in June 2011.

2.7 CONCLUSIONS

Groundwater sampling results trends indicate that the 2008 Newman Zone® injection is continuing to promote enhanced biological breakdown of chlorinated hydrocarbons. Reductive dechlorination is exhibited by the increase in VC, the daughter compound to cis-1,2-DCE. Also, PCE was not detected this sampling round, where PCE is the parent product of chlorinated hydrocarbons. The VC and cis-1,2-DCE concentrations from 2002 to 2011 are illustrated in Figure 2-2.

Additionally, the most recent round (June 2011) which is consistent with the previous sampling round (April 2010) indicate that the Newman Zone® injection is subsiding due to the decreased TOC levels. The carbon source appears to have been utilized, promoting reductive dechlorination. TOC levels have also been plotted on Figure 2-2 which shows the decrease in TOC levels following the 2008 injection event.

Following the 2008 Newman Zone® injection in monitoring well B035MW-4, the monitoring well exhibited a type 1 environment (groundwater systems that are highly anaerobic due to high levels of organic carbon). However, the site is now exhibiting a type 2 environment (groundwater systems that are mildly anaerobic due to moderate levels of organic carbon). An indicator of this is an increase in sulfate concentrations. Sulfate levels have increased, from 11 mg/L in April 2010 to 14 mg/L in June 2011. The increase is attributed to the decrease in active sulfur reducing bacteria which are prominent in anaerobic environments (AFCEE, August 2004).

2.8 RECOMMENDATIONS

A carbon source injection occurred in July 2011which will result, if successful, in changing the environment to a type 1 environment which is conducive for the dechlorination of the residual

contamination. It is recommended to continue monitoring on an annual basis (summer) at monitoring well B035MW-4 to confirm the effectiveness of this injection. Table 2-2 provides the Building 35 AOC groundwater sampling and analytical results summary.

RE: **Injection Points at Building 35 On-Base Groundwater Area of Concern, former Griffiss Air Force Base, Rome, NY**

Dear Frank Brock:

FPM is proposing injection points associated with the above referenced project. The work is part of the Long Term Monitoring Program managed by the Air Force Center for Engineering and the Environment (AFCEE). The goal is to remediate a contaminated groundwater plume where contaminate of concern is chlorinated solvents. The site location is shown in the attached figure, Figure 2-1 Building 35 AOC Site Location Map. Building 35, approximately 1 acre in size, is currently a parking lot for Birnie Bus Service, Inc. The soils are predominantly composed of silty, fine to coarse sands with gravel. It is anticipated that the work will be performed July 5 and 6, 2011.

The anticipated work consists of four temporary injection points, orientated with an arc shape surrounding B035MW-4, and a 15 feet spacing. Two points are anticipated to be in the parking lot and two points in the grass. The material being injected is 2% Newman Zone® by volume, with a total volume of 3,750 gallons. The volume per point is 937.5 gallons. The injection depth is 16 to 8 feet below grade.

Should you have any questions of require additional information, please call Katrina Mattice at 315-336-7721 ext 212 or email at k.mattice@fpm-remediations.com.

Sincerely,
Katrina Mattice

USEPA REGION II SUPPLEMENTAL INSTRUCTIONS FOR COMPLETING INVENTORY OF INJECTION WELLS

EPA FORM 7520-16 (Rev. 8-01)

SECTION 2. FACILITY ID NUMBER: Leave blank. EPA will assign an ID number.

SECTION 3. TRANSACTION TYPE: Check either First Time Entry or Entry Change. If this is the first time you have submitted this form for your injection wells(s), check First Time Entry and fill in all the appropriate information. If you are modifying information you sent in before, check Entry Change, fill in the Facility Name and Location and fill in the information that has changed. (Note: If the facility name has changed, in the blank space in the upper left hand corner write the prior facility name under which the form was first submitted, and the date it was submitted.)

SECTION 4. FACILITY NAME AND LOCATION: If you know the latitude and longitude of your facility, fill in line 4C and 4D. You do not need to fill in 4E, Township/Range. If you know the Numeric County Code, fill in line 4I, otherwise just write in the name of the County.

SECTION 5. LEGAL CONTACT: Under 5A, if the Legal Contact you are identifying owns the land, check Owner. If the Legal Contact owns and/or operates the business but someone else owns the land, check Operator. Under 5I, "Private" means privately owned. "Public" means owned by local/municipal government. "State" and Federal" mean owned by state/federal government.

SECTION 6. WELL INFORMATION: Under 6A CLASS AND TYPE, use the attached table "USEPA Region II List of Class V Injection Well Types" to determine the **CLASS V** "TYPE". Enter the appropriate Type Code in 6A (the Type Code does not have to fit within the two boxes on the Inventory Form). Select the Class V well type(s) that most accurately fit the well(s) at your facility. When reviewing the attached table and making your determination, be sure to consider all of the fluids entering the well or having the potential to enter the well. For example, Storm Water Drainage Wells located in industrial areas which are susceptible to spills, leaks or other chemical discharges are inventoried as Industrial Drainage Wells. If Cesspools and Septic Systems are receiving fluids other than sanitary waste (human excreta), that should be noted in the Additional Information below.

IMPORTANT: ADDITIONAL INFORMATION

In order to ensure that the **Class V** Well(s) at your facility are accurately inventoried you must also submit on a separate piece of paper: (1) a brief description characterizing your facility and the types of activities conducted; (2) a brief description of what you use each of your injection well(s) for; (3) a brief description of the types of fluids that enter, or have the potential to enter, each of your injection well(s). (Note: wells with the same information may be grouped).

If you require assistance, please contact EPA Region II at (212) 637-3093.

DELIVERABLES

The data deliverable report was per requirements of the DOD QSM, version 4.2, as specified in the project-specific QAPP. The report consisted of the following major sections: lab attachment letter, case narrative, chain-of-custody, lab qualifier definitions, analytical results (sheet 2) based on analytical batch, calibration summaries, method blank summaries, laboratory control sample summaries, matrix spike/matrix spike duplicate summaries, holding time forms, performance checks, surrogate and internal standard recoveries, as applicable.

ANALYTICAL METHODS

The analytical test methods and QA/QC requirements used for the sample analyses were per methods as specified in the DOD QSM, version 4.2, with project-specific modifications as listed in the project-specific QAPP. The analytical methods employed included SW-846: Volatile Organic Compounds (VOC) by Method SW8260B (short list), Total Organic Carbon (TOC) by Method SW 9060A, Total Dissolved Solids by Method SM 2540C, Total Alkalinity by Method SM 2320 B, Anions by Method SW9056, Ammonia by Method 350.1, Total Kjeldahl Nitrogen by Method 351.2, Color by Method SM 2120B, and Hardness (as calcium carbonate) by Method SM 2340C.

VERIFICATION GUIDANCE

The analytical work was performed by TestAmerica Laboratories, Inc. in accordance with the DOD QSM, version 4.2, and QC requirements of the respective analytical methods and of the project-specific QAPP. The data usability analysis was based on the reviewer's professional judgment and on an assessment of how this data would fare with respect to the DOD QSM, and the criteria as listed in the project-specific QAPP.

QA/QC CRITERIA

The following QA/QC criteria were reviewed, as applicable and available:

- Method detection limits (DLs) and limits of quantitation (LOQs)
- Holding times, sample preservation and storage
- Second source calibration verification summary
- Initial and Continuing calibration summaries
- Method blanks
- Field duplicate results
- Matrix spike/matrix spike duplicate (MS/MSD) analysis
- Laboratory control samples (LCS)
- Results reported between DL and LOQ (J-flag)
- MS tune performance
- Ambient, equipment, and trip blanks (as applicable)
- Surrogate spike recoveries
- Internal standard areas counts and retention times
- Sample storage and preservation

- Data system printouts
- Qualitative and quantitative compound identification
- Chain-of-custody (COC)
- Case narrative and deliverables compliance

The items listed above were in compliance with DOD QSM, version 4.2, and project-specific QAPP criteria and protocols with exceptions discussed in the text below. The data have been verified according to the procedures outlined above and qualified accordingly.

GENERAL NOTES:

MISSING SAMPLES

None. All samples documented on the chain of custody were received by the laboratory.

BLANKS

Whenever blanks, including method, ambient, equipment, and trip, contained low levels of contaminants (between the DL and LOQ), the laboratory and/or data verifier qualified the subject results with a "J" flag. Since no qualification of associated field samples are required for blanks less than half the LOQ, no further action was taken in such instances.

VOLATILE ORGANIC COMPOUNDS (VOCs)

- There were no exceedances for VOCs.

WET CHEMISTRY ANALYTES

- According to the case narrative, sample B035M0416JA required a 1:5 dilution for chloride after original results were above the calibration curve. Use diluted sample results for this compound only. Original sample results are modified accordingly.

- The following blank sample analyses indicated blank contaminants present at concentrations equal to or greater than half the limit of quantitation (LOQ). The Blank ID, detected contaminant, and concentration are listed.

Blank ID	Analyte	Concentration (mg/L)	LOQ (mg/L)	Samples Affected
062111JE	Ammonia	0.10	0.10	No field samples in this analytical batch sampled for this analyte
	Color	25	5.0	None, associated results non-detect
	TDS	8.0 J	10	None, associated results > 5x blank concentration
MB 280-73590/1	TDS	6.00 J	10	None, associated results > 5x blank concentration
MB 280-73955/1	TDS	8.00 J	10	None, associated results > 5x blank concentration

The purpose of laboratory, equipment or trip blank analysis is to determine the existence and magnitude of contamination resulting from lab or field activities. If contamination is found in blanks the associated sample results for these analytes may be considered suspect. As per the QAPP, based on the blank contaminants present above half the LOQ, results for the specific analytes in the associated environmental samples are qualified with a "B" flag. However, in accordance with the EPA National Functional Guidelines and consistent with the QAPP, the "B" flag is **not** applied for sample results that are greater than five times (5x) the blank concentration. Thus the "B" flag is only applied to those samples for which the sample result is positive and less than five times (5x) the blank concentration.

Corrective Action: No "B" flags were applied to the result for the field samples, since associated results were either greater than 5x the blank or non-detect.

DATA USABILITY RESULTS

VOCs

Based on the evaluation of all information in the analytical data groups, the results of the samples for VOCs are highly usable with the data qualifiers as noted. Using the verification approach as presented above, the results for all above samples are 100% usable.

WET CHEMISTRY ANALYTES

Based on the evaluation of all information in the analytical data groups, the results of the samples for wet chemistry analytes are highly usable with the data qualifiers as noted. Using the verification approach as presented above, the results for all above samples are 100% usable.

AFCEE SUMMARY

CASE NARRATIVE
Client: FPM Engineering Group, PC
Project: Griffiss AFB B35 LTM
Report Number: 280-17248-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

CASE NARRATIVE
Client: FPM Engineering Group, PC
Project: Griffiss AFB B35 LTM
Report Number: 280-17248-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.
