INTRODUCTION

- 2 This Installation-Specific Work Plan Addendum (ISWPA) presents information regarding perfluorinated
- compound (PFC) release determination activities at fire training area (FTA) site FT030P¹, located at the
 former Griffiss Air Force Base (AFB) in Rome, New York (Figure 1). This document is provided as an
- addendum to the general Quality Program Plan (QPP) (AMEC, 2014). This ISWPA has been prepared under
- 6 Contract No. FA8903-08-D-8766, Task Order (TO) 0177 between AMEC Environment & Infrastructure, Inc.
- Contract No. PA6905-08-D-6766, Task Order (TO) 0177 between Amee Environment & Imrastru
- 7 (AMEC) and the Air Force Civil Engineering Center (AFCEC).
- 8 Combined, this addendum and the QPP have been prepared to ensure (1) the site investigation objectives
- 9 and data quality objectives (DQOs) for this project are clearly identified; (2) the field sampling protocols
- 10 are documented and reviewed in a consistent manner; and, (3) the data collected are scientifically valid
- and defensible. This ISWPA includes specific Uniform Federal Policy (UFP) Quality Assurance Project Plan
- 12 (QAPP) worksheets to accompany the general QPP. Installation-specific Health and Safety Plan (HSP)
- 13 information is provided in **Appendix A** of this addendum (AMEC, 2014).

14 INSTALLATION AND FTA HISTORY

- 15 Griffiss AFB was established as the Rome Air Depot on 1 February 1942. Construction of the installation
- 16 began in August 1941 and flying operations on the depot airfield began on 18 February 1942. Prior to
- 17 construction of the installation, the land was primarily pasture and cropland with scattered farmsteads,
- except for a small housing subdivision with more than 100 lots which had been established in the mid-
- 19 1930s in the area northwest of Building 101.
- During World War II, activities at the installation centered on aircraft engine maintenance and repair, and the training of air depot groups in engine repair. A number of the original buildings constructed in the central portion of the installation for these activities remained, including Building 106, a former engine
- repair facility; Building 112, a former engine test cell facility; and Building 115, a former engine storage
- 24 and cleaning facility.
- 25 Electronic research activities began in 1949 at Griffiss AFB. The Watson Laboratory complex transferred
- 26 from Red Bank, New Jersey and became the Rome Air Development Center in June 1951 (later known as
- 27 Rome Laboratory). The original northwest-southeast trending runway was upgraded and extended in the

¹ The FTA historically has been addressed under the Installation Restoration Program (IRP) under site designation FT030. To manage and administer PFC-related site investigation, characterization, and mitigation activities, the Air Force has defined the site with a new identification that adds a "P" to the IRP site identification. The corresponding site identification, FT030P is used throughout this document.

Final Installation-Specific Work Plan Addendum, Former Griffiss Air Force Base November 2014

early 1950s to handle jet fighter aircraft for the 49th Fighter Interceptor Squadron that was stationed at
 Griffiss AFB. Various fighter interceptor aircraft were at Griffiss AFB from 1950 to 1987.

3 In 1956, a major expansion of the existing airfield was initiated, including the construction of a new 11,500-foot (ft)-long runway (Runway 15/33), associated taxiways, Aprons 1 and 2, and an Alert Apron. in 4 1970, the 416th Bombardment Wing of the Strategic Air Command was activated at Griffiss AFB, requiring 5 construction of support facilities for KC-135 tanker and B-52 bomber aircraft adjacent to Aprons 1 and 2 6 7 and the Alert Apron. These facilities included a series of aircraft maintenance hangars (or nose docks) 8 adjacent to Apron 2 and various industrial shops and administrative buildings on a hill overlooking the 9 three aprons. The Barge Canal Bulk Fuel Storage Area and associated hydrant fueling systems at Aprons 1 and 2 were also completed in the late 1950s. 10

The Weapons Storage Area was constructed in the late 1950s in the northeastern portion of the installation, east of the new runway. This facility replaced a small munitions storage bunker facility which had been constructed in the early 1950s to the west. The Weapons Storage Area was expanded in the late 1970s and early 1980s with the construction of a number of storage igloos and other support facilities for the air launch cruise missile, and the short range attack missile. The North American Aerospace Defense Command Operational Control Center (now the Eastern Air Defense Sector) facilities (Buildings 700 and 702) were completed in the early 1980s.

Griffiss AFB was designated for realignment by the Base Realignment and Closure (BRAC) commission in 1993 and closed in 1995. The New York Air National Guard continued its air operations and managed the airfield until October 1998, at which time the military flying mission at Griffiss ended. Parcels at the property have been, and continue to be, turned over to the Griffiss Local Development Corporation, which promotes, facilitates and oversees the redevelopment of the former installation. Significant facilities at the former installation include the Griffiss Business and Technology Park, the Air Force Research Laboratory, Defense Finance and Accounting Service, and the Eastern Air Defense Sector.

The Base Fire Control Department operated an FTA (FT030P) just west of the northwestern end of the main runway (Figure 2). The FTA was located between Six Mile Creek and the Mohawk River. The FTA was in operation from the 1960s to base closure in 1995 to simulate aircraft fuel fires. Petroleum fires were set for burning and extinguishing practice approximately three times a year (Law, 1995). JP-4 fuel and waste JP-4 were the most common fuels used in the fire training exercises.

30 FTA activities originally occurred on bare soil at this site. In 1985, contaminated soil was removed, and a new FTA was constructed at the same location. Contaminated soil was defined as soil with oil and grease 31 32 contamination greater than 10 parts per million (ppm). Approximately 500 cubic yards of soil were 33 removed during the remediation action. A 1985 letter from the Installation Environmental Coordinator to the Oneida County Department of Public Works requested that soil be used as daily cover at the Oneida 34 County Ash Disposal Landfill. No confirmation regarding the acceptance of this request has been located. 35 The reconstructed FTA consisted of a clay-lined concrete basin that was approximately 100 ft in diameter 36 and contained a mock aircraft in its center. A JP-4 underground storage tank (UST) was located northeast 37

- of the concrete basin. The UST supplied the fuel through an underground pipeline to ignite fires. An oil/water (O/WS) separator system was used to collect the waste liquids generated during fire training; however, the system capacity was reportedly insufficient to handle the volume of waste liquids generated during the training exercises and frequently overflowed (AF, 2009). The historical layout of the FTA is
- 5 illustrated on Figure 3.

In 1993, the original 4,000-gallon O/WS and two USTs were replaced by a 10,000-gallon O/WS. The new O/WS transferred aqueous waste to a sanitary lift station and petroleum waste to the remaining UST until 1996, when the UST was replaced with an aboveground storage tank (AST). The concrete basin, covering gravel, and surrounding asphalt were removed in 1998, with the O/WS, AST, and remediation of superficial contaminated soils occurred in 1999 (FPM, 2007). Soils from the excavation activities were land farmed on Apron 1 along with other contaminated soil from the installation. The excavation areas were backfilled with treated soil from Apron 1 (although not specifically the FTA-related soil).

13 Today, the only remaining facilities associated with the former FTA are the former smokehouse, a block 14 fire rescue training structure located approximately 600 ft west of the former FTA dish. The rest of the

15 area is relatively flat, open grassland.

QAPP Worksheet #9: Project Planning Session Summary

2 Date of planning session: 25-26 March 2014

3 **Location:** Former Griffiss AFB, Rome, NY

4 **Purpose:** The purpose of the scoping visit was to: (1) review site information with the BEC; (2) understand

5 site logistics so that they could be incorporated into this ISWPA; and, (3) understand existing conditions

6 so that they could be used to develop the investigation strategy and be factored into this ISWPA and

7 subcontractor scopes of work.

8 Attendees: Mike McDermott, AFCEC (BEC at time of Scoping Visit)

9

Sean Eldredge, AFCEC Contract Support

10 Robert Singer, AMEC Region 2 Investigation Lead

11

Jerry Rawcliffe, AMEC Field Manager

The two-day site visit included an initial meeting, a site reconnaissance, discussions with current site personnel, and a meeting with airport security staff. During the initial meeting in the AFCEC office, Mr. McDermott provided AMEC with an overview of the FT030P regulatory, investigation, and

15 remediation history. Several site maps were reviewed and overall project objectives were discussed.

16 In conjunction with the meeting, AMEC met with Mr. Joe Wojonas from the United States Army Corp of Engineers who was formerly a Griffiss AFB Engineer. Mr. Wojonas provided information relative to 17 18 aqueous film forming foam (AFFF) storage and use at various locations at the former AFB. AMEC also met with Mr. Rob Cowles, a current firefighter, who was stationed at Griffiss AFB during the last five years it 19 was active. Mr. Cowles indicated that the only use of AFFF during the last 5-years of base operation 20 21 occurred at FTA. The results of the interviews with Mr. Wojonas and Mr. Cowles will be documented and 22 included in a research report that is currently being prepared by AMEC. This information will be evaluated 23 separately and is not part of the current investigation.

After the initial meeting, Mr. Daniel Baldyga from FPM Group, Ltd. joined the attendees to perform a site reconnaissance at FT030P with a particular focus on areas and facilities associated with FT030P and the locations of historic sampling at the FT030P site. FT030P sits in an open grassed area within the airfield. The terrain is relatively flat. The only evidence of the former FTA is the former smokehouse (present west

28 of the former FTA pit) and remnants of the former access road.

AMEC met with Mr. Ed Arcuri, the airport security manager, to discuss security/access requirements, work
 notifications, and logistics for working within the Griffiss International Airport airfield.

Following the site scoping visit, AMEC and AFCEC held a follow-up teleconference to review the site investigation approach in light of the scoping visit findings. During the teleconference, AMEC and AFCEC discussed the site investigation strategy and proposed sampling plan, which are discussed throughout this

34 document.

QAPP Worksheet #10: Conceptual Site Model

2 The Conceptual Site Model (CSM) (provided on Table 1) provides a description of the facility and site, past site use history, site physical characteristics, chemical release and migration mechanisms and pathways, land use, and potential receptors.

3 The purpose of the CSM is to provide background information to identify the most likely locations for PFCs to be present, and the media and receptors likely to be impacted. This information has been used to select the locations of samples

4 that will be collected and analyzed to assess whether PFCs released during firefighting training are present in surface water, sediment, and groundwater at the site and if the PFCs have migrated offsite in surface water or groundwater.

5 Information concerning land use and receptors will be used to evaluate potential impacts to human health and the environment. Based on data collected during this site investigation, the CSM will be updated in the Site Investigation Report.

Table 1. Preliminary Conceptual Site Model Summary

. •

Physical Profile	Release Profile Land Use and Exposure Ecological Profile.
the FTA, the soil may be impacted with PFCs. The final reuse of FTA soils was not documented. • Non-PFC site contaminants are being addressed under a separate Record of Decision that includes land use controls for soil vapor intrusion. The site has been recommended for close out (unrestricted use) and is awaiting regulator response. • Current land use controls (for soil vapor intrusion) at FT030P have been recommended for removal as part of the Site Closeout Report/ Recommendation that is currently pending regulatory concurrence.	Fuel contaminated soil from the FTA was excavated in the late 1990s and land farmed on Apron 1 and Apron 2 along with other contaminated soil from across the installation. When analytical data indicated fuel compounds were below guidance values, this soil was used as backfill around the installation. This soil may have contained PFCs. No complete documentation has been identified regarding the final use of land farmed soils, however some of the land farmed soil was reportedly deposited in Landfill No. 1.

1

QAPP Worksheet #11: Project/Data Quality Objectives

2 The following presents site-specific DQOs for the proposed investigation at FT030P. These DQOs were

- 3 developed using USEPA Guidance on Systematic Planning Using the Data Quality Objectives Process EPA
- 4 QA/G-4 (USEPA, 2006).

5 Step 1: State the Problem

6 AFFF, which contains PFCs, was used at FT030P from 1970 through 1995. PFCs are an emerging 7 contaminant and may become subject to regulation in the future.

8 Step 2: Identify the Goals of the Study

- 9 The objectives of this investigation are to:
- Assess whether there are PFCs in surface soil, subsurface soil, and groundwater at FT030P from
 past use of AFFF at the site for fire-fighting training;
- Assess whether there are PFCs in groundwater downgradient of the fire training pit, within the
 airfield fence line; and
- Assess whether PFCs are present in water and sediment within the storm drain system at the
 FT030P.

16 Step 3: Identify Information Input

- 17 The following data and informational needs are required to achieve the project goals:
- Collection and laboratory analysis of soil samples from soil borings drilled at areas where fire fighting training occurred and AFFF was likely to have been used;
- Collection and laboratory analysis of groundwater samples in areas where fire-fighting training
 occurred and AFFF was likely to have been used as well as downgradient of the fire training pit;
 and,
- Collection and laboratory analysis of surface water and sediment samples from the storm drain
 system.

25 Step 4: Define the Boundaries of Data Collection

26 The investigation boundaries are defined horizontally by the area where fire training occurred as well as 27 the airfield fence line downgradient of the site. Data collection will be limited to unconsolidated, shallow

- 28 groundwater.
- 29 Step 5: Develop the Analytical Approach
- 30 Analytical data will include the analysis of the following PFCs:
- Perfluorooctanoic Acid (PFOA),

- Perfluorooctanesulfonic Acid (PFOS),
- Perfluorohexanesulfonic acid,
- Perfluoroheptanoic acid,
- 4 Perfluorononanoic acid, and
- 5 Perfluorobutanesulfonic acid.

6 Sampling of soil, surface water, sediment, and groundwater is necessary to assess whether PFCs are

7 present at the site and downgradient of the site. **Table 2** (below) and Worksheet 15 of the QPP identify

8 the project action limits (PAL) for determining a release of PFCs in soil, sediment, and groundwater for

9 PFOS and PFOA. The remaining PFCs do not have established PALs.

10

Table 2. Project Action Limits for PFOA and PFOS Analysis

Method/Instrument	Media	Target Reporting Limits
LC-MS-MS	Groundwater	PFOS 0.2 μg/L
	Groundwater	PFOA 0.4 μg/L
LC-MS-MS	Soil	PFOS 5 mg/kg
	Sediment	PFOA 12 mg/kg

11	Notes:
12	The action levels were taken from the 27 August 2012 Air Force Guidance on Sampling
13	and Response Actions for Perfluorinated Compounds at Active and BRAC Installations.
14	The water action levels are based on the USEPA Office of Water Provisional Health
15	Advisories for PFOS and PFOA. The soil and sediment levels were calculated based on
16	the Office of Superfund Remediation and Technology Innovation (residential, direct
17	contact) for PFOS and PFOA.

- 18 $\mu g/L = micrograms per liter$
- 19 mg/kg = milligrams per kilogram
- 20 LC-MS-MS = Liquid chromatography by tandem mass spectrometry
- 21 Step 6: Specify Performance or Acceptance Criteria
- Daily standardized PFC personal protective equipment (PPE)/equipment checklist (provided in the
 PFC protocol standard operating procedure [SOP]) will be completed daily for each installation.
 The quality assurance (QA) manager will review and accept the final checklist.
- QA manager or designee will verify field procedures defined in the QPP and installation-specific
 work plan are properly followed through field audits. Any deviations will be promptly addressed,
 documented, and addressed.

- The laboratories will analyze proficiency testing samples to demonstrate capability prior to the
 sampling program beginning. The laboratories will identify and quantify proficiency testing
 samples within acceptance limits to verify reporting of PFCs. Any findings or recommendations
 will be addressed prior to analysis of field samples.
- The project chemist will conduct an audit prior to sampling to evaluate laboratory procedures,
 quality program, and operations to verify the analytical procedure. Any findings or
 recommendations will be addressed prior to analysis of field samples.
- The laboratories will adhere to analytical performance/acceptance criteria per method as detailed
 in the Department of Defense Quality Systems Manual V5.0 and defined on Worksheet #12.
- PFCs by liquid chromatography/mass spectrometry/mass spectrometry (LC/MS/MS) will provide
 an acceptable detection limits to confirm presence of PFCs at concentrations defined in Step 5
 and Worksheet 15.
- USEPA Stage 2B data verification will be conducted on 100 percent of the data and USEPA Stage
 IV data validation will be conducted on 10 percent of the analytical data by an experienced
 chemist to assess the data usability. The data usability will then be evaluated by the appropriate
 agencies for final approval. Data completeness of 90 percent usable data is required.
- 17 Step 7: Develop the Detailed Plan for Obtaining Data

The detailed plan for obtaining the data is presented in the following worksheets: 13, 14/16, 17, 18, and20.

Final Installation-Specific Work Plan Addendum, Former Griffiss Air Force Base November 2014

Data type	Source	Data uses relative to current project	Factors affecting the reliability of data and limitations on data use

1 Installation Scoping Visits

2 A scoping visit was held on 25-26 March 2014. See QAPP Worksheet #9 for details.

3 Mobilization/Demobilization

One mobilization to the installation will be required to complete the work. Prior to the initial mobilization,
the following activities will be conducted.

- QPP and Health and Safety Planning AMEC field personnel will review the project SOPs, work
 plan and general and site specific health and safety requirements, as well as subcontractor HSPs
 and training records.
- Utility Clearances and Dig Permits Fourteen days prior to mobilization of drilling equipment, Dig
 Safely New York will be notified to mark underground utilities. The presence of utilities near
 drilling locations will be verified using a hand-held magnetometer or utility probe by a private
 utility location contractor.

13 Environmental Sampling

To confirm releases of PFCs at FT030P, soil, storm water, and groundwater sampling will be conducted at
 pre-selected locations (Figure 4). Worksheet #18 presents the sampling locations at FT030P. The general
 QPP provides the SOPs and description of sampling activities.

17 A summary of the proposed field sampling activities is provided in **Table 3** and are described in the 18 following sections.

Base	Site ID	Temporary Monitoring Well Installations	Soil Borings Advance	Soil	Ground water	Storm Sewer Surface Water	Storm Sewer Sediment	Laboratory- Supplied Water
Griffiss AFB, NY	FT030P	9	6	18	9	2	2	0
		Field Duplicates	(1 for every 10)	2	1	1	1	0
	QA/QC	Equipment Rinsates (1 per day per equipment setup) ^a		0	0	0	0	4
	Samples	Field Blank ^b		0	0	0	0	1
		MS/MSD (1 per 20) ^c		1	1	1	1	0
	<u> </u>		21	11	4	4	5	

Table 3. PFC Release Determination Sampling Summary

Notes:

MS/MSD Matrix spike/matrix spike duplicate.

- (a) Equipment rinsates are samples of water poured over sampling equipment to assess potential for crosscontamination; one sample will be collected for every 10 primary samples.
- (b) Field blank is a sample of PFC-free water. One sample per batch of laboratory provided water will be analyzed.
- (c) Additional sample volume will be provided for MS/MSD analysis at a frequency of one sample for every 20 samples.

2 Soil Boring Advancement/Abandonment and Soil Sample Collection

Soil borings will be advanced using direct-push technology (DPT) in the FTA source area. Soil cores will be collected continuously to the top of the water table (approximately 12 ft bgs). Samples will be collected for PFC analysis at 5-ft intervals from 3-ft below grade to the soil-groundwater interface. Specific details and procedures related to soil sample collection can be found in SOP AMEC-02 (**Appendix C**) of the General QPP. Worksheets 17 and 18 provide further discussion of the sample locations and rationale.

8 Storm Sewer Surface Water and Sediment Sample Collection

Surface water and sediment samples will be collected from the storm drain by the immersing method
specified in the SOP. Required equipment will include telescoping poles with sample collection containers.
Specific details and procedures related to surface water and sediment sample collection can be found in
SOPs AMEC-07 and 08 (Appendix C) of the General QPP. Worksheets 17 and 18 provide further discussion
of the sample locations and rationale.

14 Temporary Monitoring Well Installation and Sampling

15 Nine temporary monitoring wells are scheduled for installation and sampling under this work plan.

- 16 Temporary wells will be installed and sampled following SOP AMEC-04 and SOP AMEC-05. Due to their
- temporary nature, a bentonite seal will not be placed above the filter pack. Each of the wells will be

Final Installation-Specific Work Plan Addendum, Former Griffiss Air Force Base November 2014

sampled within 24 hours of installation using a peristaltic pump to purge and sample the groundwater. During purging, field parameters including pH, specific conductance, temperature, oxidation reduction potential, dissolved oxygen, and turbidity will be measured in accordance with SOP AMEC-03. After sampling, the casing will be pulled and the borehole will be abandoned in accordance with SOP AMEC-06. Specific details and procedures related to temporary monitoring well installation and sampling can be found in **Appendix C** of the General QPP. Worksheets 17 and 18 provide further discussion of the sample locations and rationale.

8 **PFC Sampling Considerations**

Given the low detection limits associated with PFC analysis and the many potential sources of trace levels
 of PFCs, field personnel are advised to err on the side of caution by strictly following protocols to help
 mitigate the potential for false detections of PFCs. Specific details and procedures related to sampling for
 analysis of PFCs can be found in SOP AMEC-01 (Appendix C) of the General QPP.

13 Surveying

Soil, groundwater, and surface water/sediment sample locations will be surveyed by AMEC for horizontal control using a handheld 6000 series global positioning system (GPS) receiver.

16 Investigation-Derived Waste Management

Investigation-derived waste (IDW) will consist of soil cuttings from soil boring advancement,
 decontamination water, well purge water, disposable PPE, and general trash.

PPE and trash will be placed in plastic bags and placed into sanitary trash containers and disposed at a sanitary landfill. Field personnel will change gloves frequently to prevent cross-contamination between sampling equipment and plastic trash bags. Soil IDW will be containerized in Department of Transportation (DOT)-approved 55-gallon drums. Water IDW will be contained in DOT approved 55-gallon drums pending characterization.

Characterization analytical requirements and sample frequencies will be defined by historical knowledge and the individual waste disposal facility. The analyses for IDW characterization will be determined after the subcontract with AMEC's IDW subcontractor is executed. The Air Force will be notified of the requirements a minimum of one week prior to mobilization. Analytical requirements are expected to include volatile organic compounds, semi volatile organic compounds, and PFCs.

29 Sampling for waste characterization is expected to consist of two waste streams:

- 30
- 1. Composited samples of soil collected from each of the soil borings; and,
- 31 32

2. Composited water samples collected from decontamination water and well development/purge water.

33 <u>Composited Soil Boring Samples:</u>

34 During drilling, an aliquot of soil media will be collected from every 5 ft interval drilled as the borehole is

35 progressed to total depth. All borehole cuttings will be grouped together to represent a composite IDW

- sample. The cuttings will be disposed of as a single unit of IDW with appropriate waste characterization sampling. As such, each individual drum may contain cutting waste from multiple boreholes within the FTA. The composite IDW samples will be pulled from the soil cores. Composited soil for IDW analyses will be stored in an appropriately labeled 55-gallon drum or 5-gallon bucket with a designated lid. At the end of the drilling program, the drum or bucket that houses the IDW sample aliquots will be composited (ensuring appropriate representation of all collected media). The composite sample will be placed into
- 7 laboratory supplied sample containers and shipped to the laboratory.

8 <u>Composited Groundwater IDW</u>:

- 9 During monitoring point purging and sampling it is anticipated that water IDW will be generated. IDW
- 10 water will be containerized in 55-gallon drums. A single composite sample containing aliquots of water
- 11 from each drum on site will be placed into laboratory supplied sample containers and submitted to the
- 12 laboratory for analysis at the conclusion of water generating events.

13 <u>Decontamination Water IDW</u>:

Decontamination water generated during the course of the investigation will be segregated from the 14 groundwater IDW generated during the investigation and will be clearly labeled. The water will be 15 sampled however, as one composite waste stream with the groundwater IDW. Physical segregation of 16 decontamination water from the groundwater waste stream will minimize impacts should the composited 17 water IDW sample come back as anything other than non-hazardous. If it is determined that the IDW 18 water is hazardous, AMEC will resample the decontamination water and well development water 19 20 separately in an effort to reduce the volume of hazardous waste. Samples are expected to be collected from decontamination water using a bailer. The sample will be composited and then decanted into 21 22 sample containers provided by the laboratory. The IDW will be staged in the general vicinity of the former smokehouse structure. 23 Based upon

characterization results, IDW will be profiled and transported to an offsite disposal facility. Upon completion of procurement activities, AMEC will provide the AFCEC with the information on the selected

26 transporter and disposal facility for approval. An AMEC representative with DOT Hazardous Materials

27 Transportation training or applicable equivalent waste management training or certifications will oversee

28 IDW loading for transport and disposal. The AMEC representative will sign manifests/bills of lading as an

29 "Authorized Agent for the Air Force." Copies of bills of lading/manifests will be included in the individual

30 site investigation reports.

1

QAPP Worksheet #17: Sampling Design and Rationale

Based on discussions between AMEC and AFCEC during the scoping meeting on 25-26 March 2014 and a
follow-up scoping phone call on 12 May 2014, as well as review of the document sources referenced
throughout this ISWPA, AMEC has developed a sampling program that is designed to evaluate the
potential for a PFC release at the former Griffiss AFB. The sampling plan is based on the following general
conditions known to exist at the site.

7 Condition 1: PFCs may have leached through the soil into groundwater and may be present in the
8 groundwater zone beneath the site.

9 Resulting Sampling Rationale: Install temporary well points for groundwater sample collection within
 10 the FTA footprint to assess whether impacted groundwater is present. Install temporary well points
 11 at varying distances between the FTA dish and the airfield fence line to assess whether PFCs, if
 12 present, have migrated off the FTA site as well as off the airfield.

13 **Condition 2:** AFFF was applied to the ground surface at the FTA during training excises.

Resulting Sampling Rationale: Install soil borings and collect soil samples in and around the area of
 the former FTA dish.

Condition 3: Groundwater intersects the storm water drain that traverses across the FT030P site.
 Historical documents suggest that groundwater enters the storm drain system through faults in the storm
 drain piping.

19 Resulting Sampling Rationale: Collect one upgradient sample and one downgradient sample (both 20 water and sediment if present) through catch basins in the storm sewer to assess whether PFCs are 21 present in water entering the storm drain system from the FTA. If the comparative results between 22 the up and downgradient samples are outside the range of uncertainty defined by the laboratory 23 control limits, then the difference will be considered to be a potential indication of contribution from 24 the FTA. Likewise, PFC results will be used to assess whether the storm sewer represents a pathway 25 for transport of PFCs off site.

Condition 4: The former O/WS located northeast of the FTA dish location separated the petroleum and
 aqueous wastes. The O/WS reportedly overfilled on at least one occasion (FPM 2007).

Resulting Sampling Rationale: Install two soil borings and collect soil samples in the area of the former
 O/WS and aqueous waste storage tanks (UST 6365-1, UST 6365-3 on Figure 4). Install one temporary
 well point immediately downgradient of the aqueous waste storage/treatment area.

QAPP Worksheet #18: Sampling Locations and Methods

2 All sample locations are illustrated on **Figures 4 through 6** and are described on the following table.

Group HSE Manager: John Mazur	(O): 910-452-1185	(C): 910-431-2330 (H): 910-681-0538	

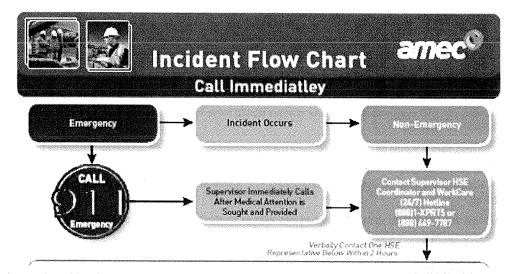

1 EMERGENCY PROCEDURES

- The health and safety officer (HSO) or alternate should be immediately notified via the on-site communication system. The HSO
 assumes control of the emergency response.
- The HSO notifies the project manager and client contact of the emergency. The HSO shall then contact the group health, safety and environment (HSE) manager who will then contact the corporate HSE manager.
- If applicable, the HSO shall notify off-site emergency responders (e.g. fire department, hospital, police department, etc.) and shall
 inform the response team as to the nature and location of the emergency on-site.
- If applicable, the HSO evacuates the site. Site workers should move to the predetermined evacuation point (labeled as "Airfield Access Gate on Figure 2\).
- For small fires, flames should be extinguished using the fire extinguisher. Large fires should be handled by the local fire department.
- In an unknown situation or if responding to toxic gas emergencies, appropriate PPE, including self-contained breathing apparatus (SCBA) if available, should be donned. If appropriate PPE is unavailable, site workers should evacuate and call in emergency personnel.
- If chemicals are accidentally spilled or splashed into eyes or on skin, use eyewash and wash affected area. Site worker should shower as soon as possible after incident.
- If a worker is injured, first aid shall be administered by certified first aid provider. See AMEC Triage Program below
- If the emergency involves toxic gases, workers will back off and reassess. Prior to re-entering the work zone, the area must be
 determined to be safe. Entry will be using Level B PPE and utilize appropriate monitoring equipment to verify that the site is safe.
- Within 24 hours after any emergency response, the Incident Analysis Report (and Vehicle Incident Report if vehicle incident) shall be completed and returned to the group HSE manager, who will forward a copy to the corporate HSE manager. Injuries requiring medical treatment beyond first aid (as well as work-related vehicle incidents) will require the employee to submit a post incident drug and alcohol test.

AMEC WorkCare Program

- If the emergency involves an injury to an AMEC employee, the local HSE coordinator, field lead are to implement the AMEC WorkCare program. Employees whose injuries are true emergencies and who need immediate medical attention will initially bypass this program and are to be immediately sent/taken to the hospital identified in the routes to emergency medical facilities section below.
- For non-emergency injuries, the supervisor field lead and the injured employee will contact the AMEC WorkCare 24/7 Hotline at 1-888-449-7787 and speak to a nurse case manager. The nurse case manager will perform the intake process and ask for information including the following:
 - o Explain the process to the caller
 - Determine the nature of the concern
 - Provide appropriate medical advice to the caller
 - o Determine the appropriate path forward with the caller
 - o Maintain appropriate medical confidentiality
 - Help caller to execute path forward including a referral to the appropriate local medical facility
 - Send an email notification to the corporate safety contact
- From this, a collaborative decision will be made between the nurse case manager and the injured employee on the most appropriate
 place for treatment; either the hospital, the clinic, or onsite first aid
- If the employee is to be sent to a clinic or hospital, the nurse will call ahead to explain the situation, the need for testing, and advises
 options to avoid OSHA recordable & considerations for return to work & transitional/modified duty. The nurse will also arrange for
 drug and alcohol testing to be conducted at the hospital/clinic. If the employee is to be treated on site (First Aid), the nurse will
 advise the employee to call if injury gets worse. Attached is a flow diagram that describes this procedure.
