RE: January Monthly Progress Report  
Contract # DACW41-01-D-001-0006  
Vestal Wellfield 1-1, Area 4, Vestal, New York

Sirs:

Enclosed is the January Monthly Progress Report for the referenced contract. This report covers system operations from 1 January 2005 through 31 January 2005. O&M activities for the period as well as sampling activities are summarized in this report. Copies of the analytical data are included.

Please email me at [cmarshall@sevensonphilly.com](mailto:cmarshall@sevensonphilly.com) or call at 610-388-0721 if you've any questions.

Sincerely,  
Sevenson Environmental Services, Inc.

## **1.0 INTRODUCTION**

Envirogen/Shaw E&I, Inc. has prepared this Monthly Progress Report for the operation of the Soil Vapor Extraction System (SVE system or System) for the Vestal Well 1-1 Superfund Site, Area 4 in Vestal, NY. This report was prepared under a subcontract to Sevenson Environmental Services, Inc, under contract DACW41-01-D-0001-0006. Sevenson's remedial action work is under supervision of the U.S. Environmental Protection Agency (USEPA) and the U.S. Army Corps of Engineers (USACE).

Figure 1 is a Site plan showing the SVE System treatment area, comprised of Cells 1 and 2 and other major components of the System. Construction of the SVE System began in early April and was completed in late June 2003. Start-up of the SVE System began on June 23, 2003. The SVE System is operated in accordance the Final Design documents, O&M Manual and subsequent correspondence with the USEPA and USACE. This report covers the time from January 1 to January 31, 2005.

Section 2.0 of this report summarizes general activities conducted during the reporting period. Section 3.0 summarizes System monitoring and adjustments. Section 4.0 discusses volatile organic compound (VOC) contaminant yields based on process air analytical data and flow rates. Section 5.0 discusses problems encountered during the reporting period and their respective corrective measures. Section 6.0 lists anticipated future activities.

## **2.0 SUMMARY OF ACTIVITIES CONDUCTED DURING THE REPORTING PERIOD**

The monthly O&M inspection was performed on January 12, 2005. Airflow, pressure/vacuum, and PID readings were measured throughout the System on January 12, 2005. Process air sampling of the System (influent, mid-carbon and effluent) was performed on January 12, 2005.

The SVE System at the Vestal Area 4 Site ran approximately 30 days during the period 1/1/05 to 1/31/05, without incident.

Physical monitoring of the System parameters, such as vacuum/pressure, temperature, PID readings, and air flow measurements, along with routine maintenance of the System, was conducted during the December reporting period in accordance with the O&M Manual. These O&M measurements and site activities were recorded on daily O&M logs, which are available on-site.

The System was operational approximately 30 days from January 1 to January 31, 2005. This brings the total operational time to approximately 472 days since the June 23, 2003 start-up.

### **3.0 SVE SYSTEM MONITORING AND ADJUSTMENTS**

This section summarizes monitoring of and adjustments to the SVE System during the reporting period. Monitoring of the System included pressure/vacuum and temperature measurements, air flow measurements, and process air sampling and associated VOC analysis. The locations of the SVE wells are illustrated in Figure 1. System parameters were recorded on O&M daily log sheets, available on-site. The chain-of-custody forms and laboratory data summary sheets are provided in Appendix A. All monitoring and/or adjustments were performed in accordance with the O&M Manual.

#### **3.1 Process Air Flows**

This section discusses process air flow measurements and balancing throughout the entire System and for the individual SVE wells. Individual SVE withdrawal and injection well process airflow measurements and PID readings were taken on January 12 and are provided in Table 1.

##### **3.1.1 Total System Process Air Flow**

During the reporting period, airflow throughout the entire System was measured as outlined in the O&M Manual. The airflow through the System was calculated by measuring amount of vacuum, temperature, speed of the SVE blower, elevation, then using these values to obtain the air flow from the blower curve computer model supplied by the manufacturer (Roots Inc.). Based on this data, the calculated airflow through the entire System on January 12, 2005 averaged 512 cubic feet per minute (cfm). This data is shown in Appendix B. The bypass airflow for January 2005 was approximately 210 scfm.

##### **3.1.2 SVE Well Process Air Flow**

Individual SVE withdrawal well process airflow measurements were recorded on January 12, 2005. In addition, PID readings were recorded when process air samples were taken. During the January 12, 2005 System sampling event, PID readings were also taken on the individual SVE withdrawal wells. This data is contained in Table 1.

### **3.2 Process Air VOC Concentrations**

Process air samples were collected during the reporting period on January 12, 2005. Samples were collected and analyzed in accordance with the O&M Manual. The system process air analytical results are contained in Appendix A.

## **4.0 VOC YIELD**

This section details the System VOC yield based on System sampling events performed during the January 1 to January 31, 2005 reporting period. Discussed in this section is the estimated Total Targeted Contaminant (TTC) VOC yield, based on the airflow through the blowers and the composite/total system VOC analytical results. Table 2 shows the total target contaminant yield for each sampling period.

### **4.1 Total System VOC Yield**

The total System VOC yield was calculated using the total system airflow rates and contaminant concentrations. Cumulative system contaminant yields for the reporting period are shown in Table 3. Based on these calculations, the System yielded approximately 7.43 pounds of VOCs from December 21, 2004 to January 12, 2005. The average yield rate of the System per operational day between January 1, 2005 and January 31, 2005 is 0.34 lbs/day. TCE constitutes approximately 46 percent and 1, 1, 1-TCA approximately 54 percent of the total VOC yield over the reporting period. The total TTC yield from start-up (June 23, 2003) to January 12, 2005 is 2,030.87 pounds. The mass of TTC VOCs removed from the treatment area is illustrated in Figure 2. The cumulative contaminant yield is calculated utilizing the data and formulas found in Appendix B. Figure 3 graphically depicts cumulative yield over system operational time. As noted in the SVE System analytical data, the percent concentration of TCE within the influent process air increased from 43 to 46 percent and the concentration of 1,1,1-TCA decreased from 57 to 54 percent compared to the December 2004 analytical data.

## **5.0 PROBLEMS ENCOUNTERED DURING THE REPORTING PERIOD AND RESPECTIVE CORRECTIVE MEASURES**

With the exceptions of problems discussed in Section 2.0 and in this section the System operated well throughout the month of January.

On 20 January 2005, the EPA advised us that the Vestal Town Engineer reported a cave-in in the road proximate to the Vestal treatment site. The O&M Team mobilized immediately to get to the site that afternoon to inspect the situation. The Vestal Town Engineer was advised when we'd be at the site, was invited to join us, and met the Team at the site that afternoon.

---

The hole is on the side of Stage Road, somewhere at the edge of Area 2. We observed the hole is about 1ft wide and about 14 or 16" deep. Fallen debris was cleared and found an 8" manway with a triangle on it on top of bent piping, so it is an old monitoring well. The team took pictures and those were forwarded to the USACE and the EPA. The Envirogen Team placed gravel in the hole and placed cold patch on top, to mitigate the immediate safety hazard. We have instruction from the EPA via USACE to properly abandon this well. A strategy to obtain the appropriate well construction data (obtaining this data via the well log or via an investigation) in order to price the abandonment work has been developed and is ongoing. The data needed includes: well depth; diameter of well; screen length; lithography (presence of a confining layer, bed rock or overburden); is the area located in a contaminated plume or in known contaminated soil.

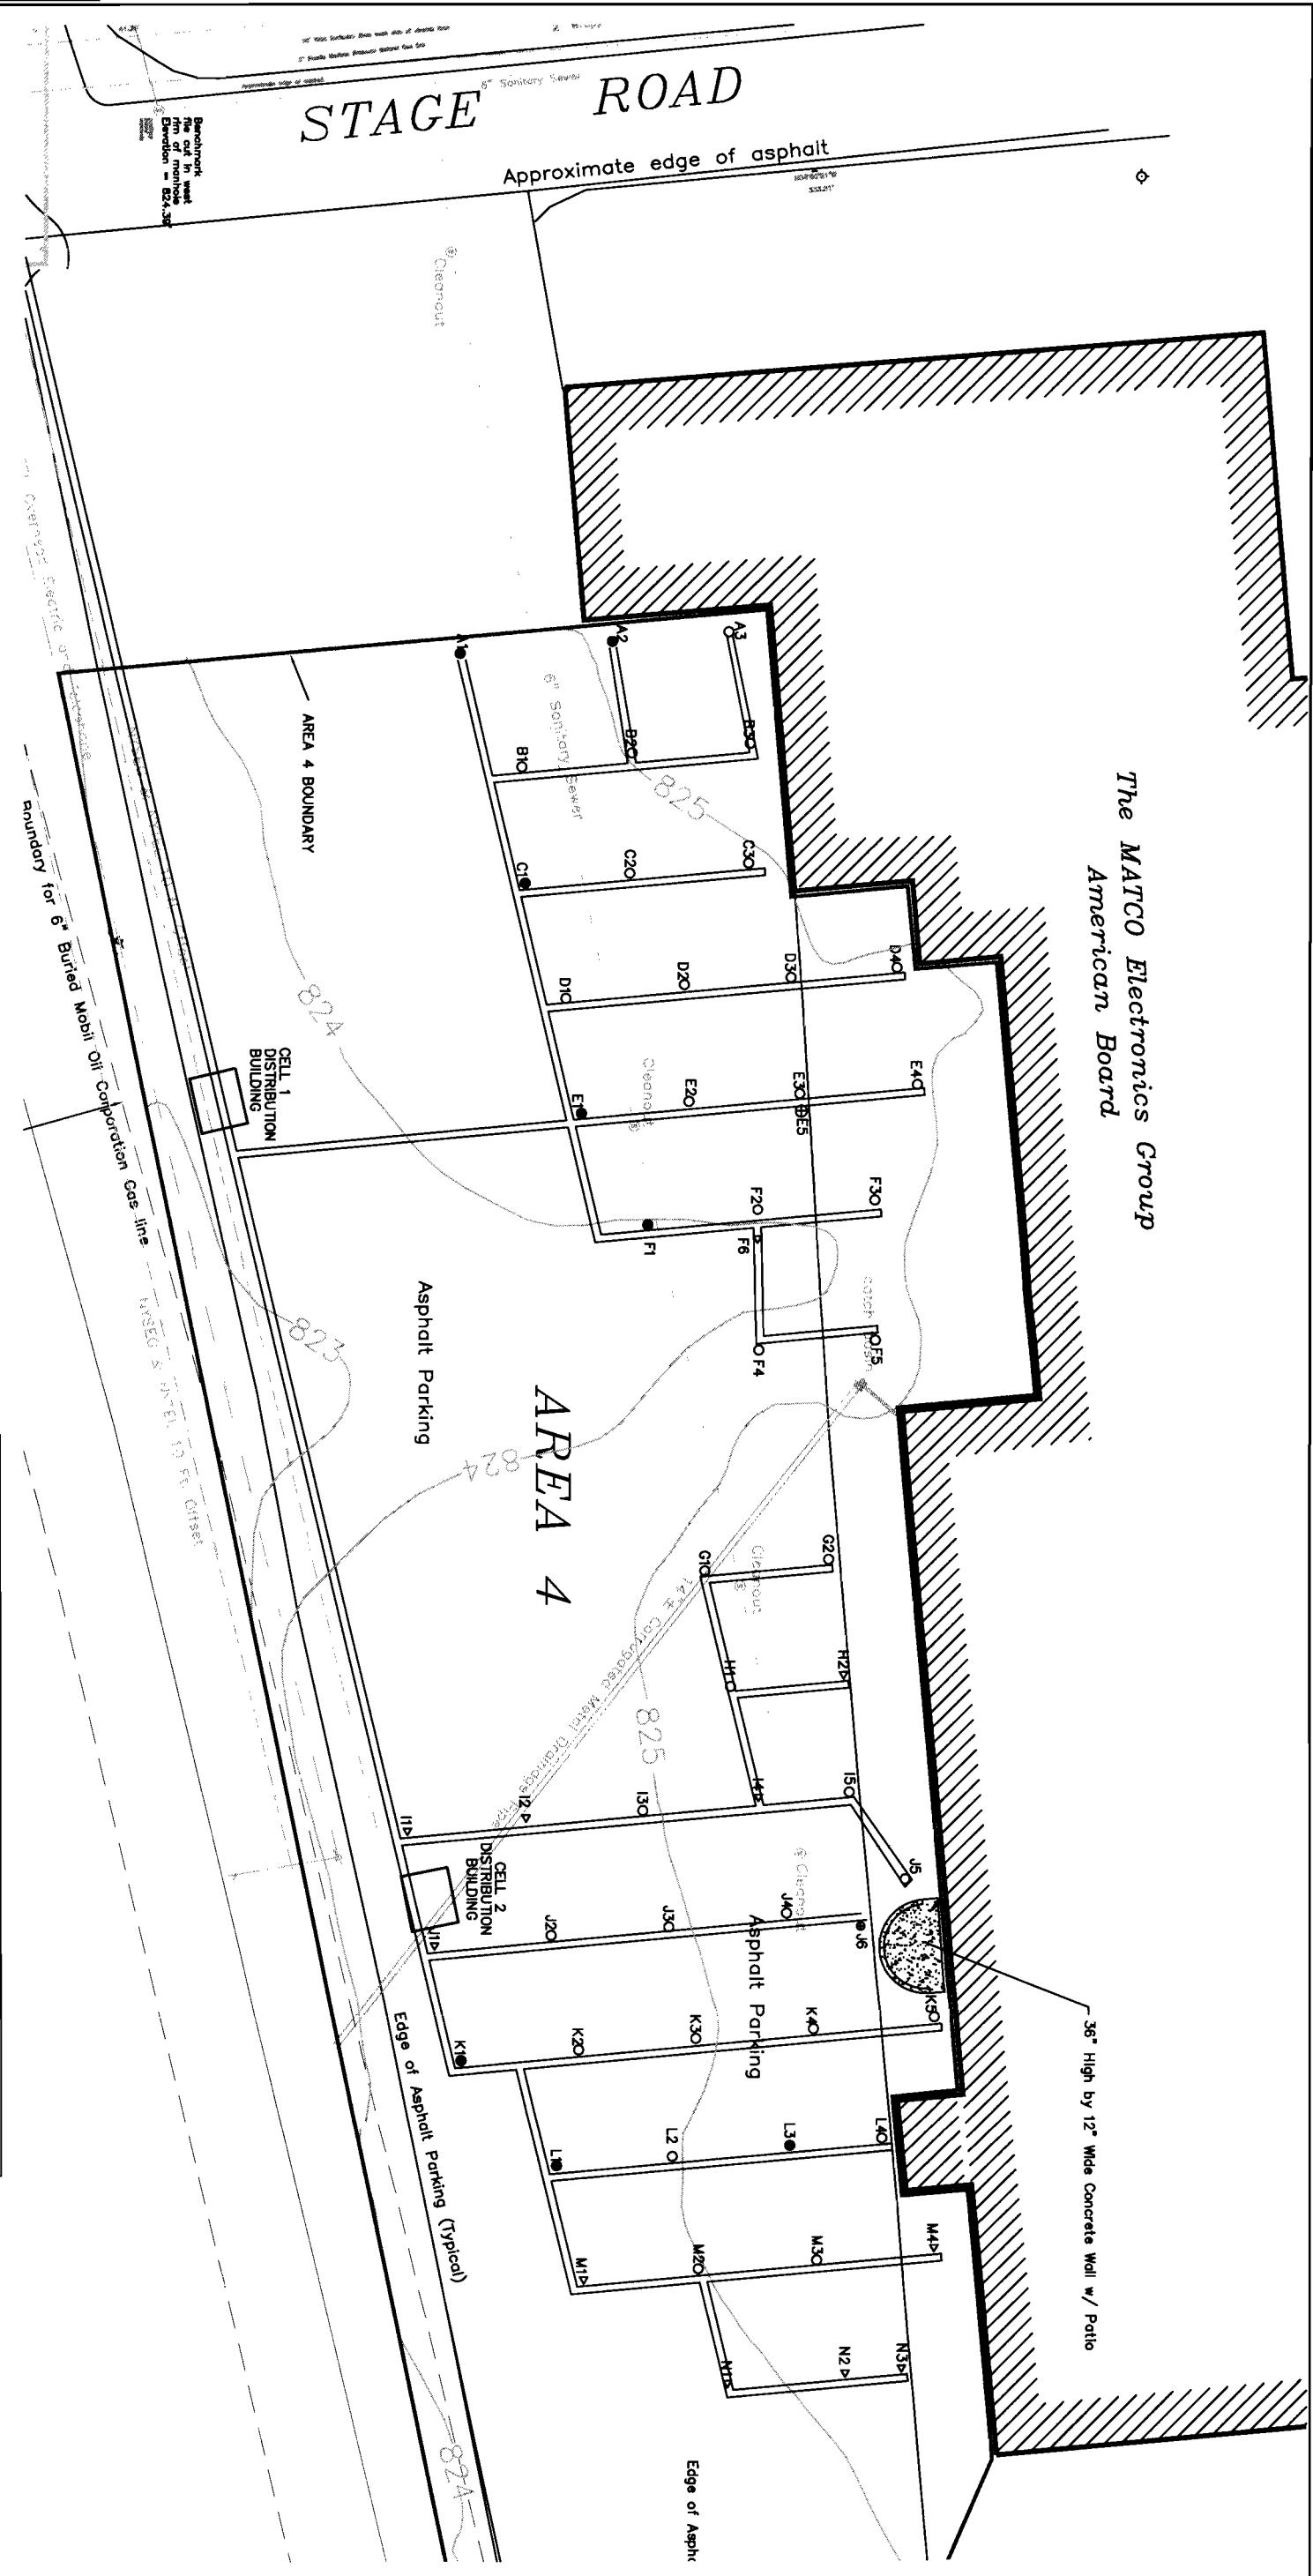

## 6.0 ANTICIPATED ACTIVITIES

The following activities are anticipated for the next reporting period.

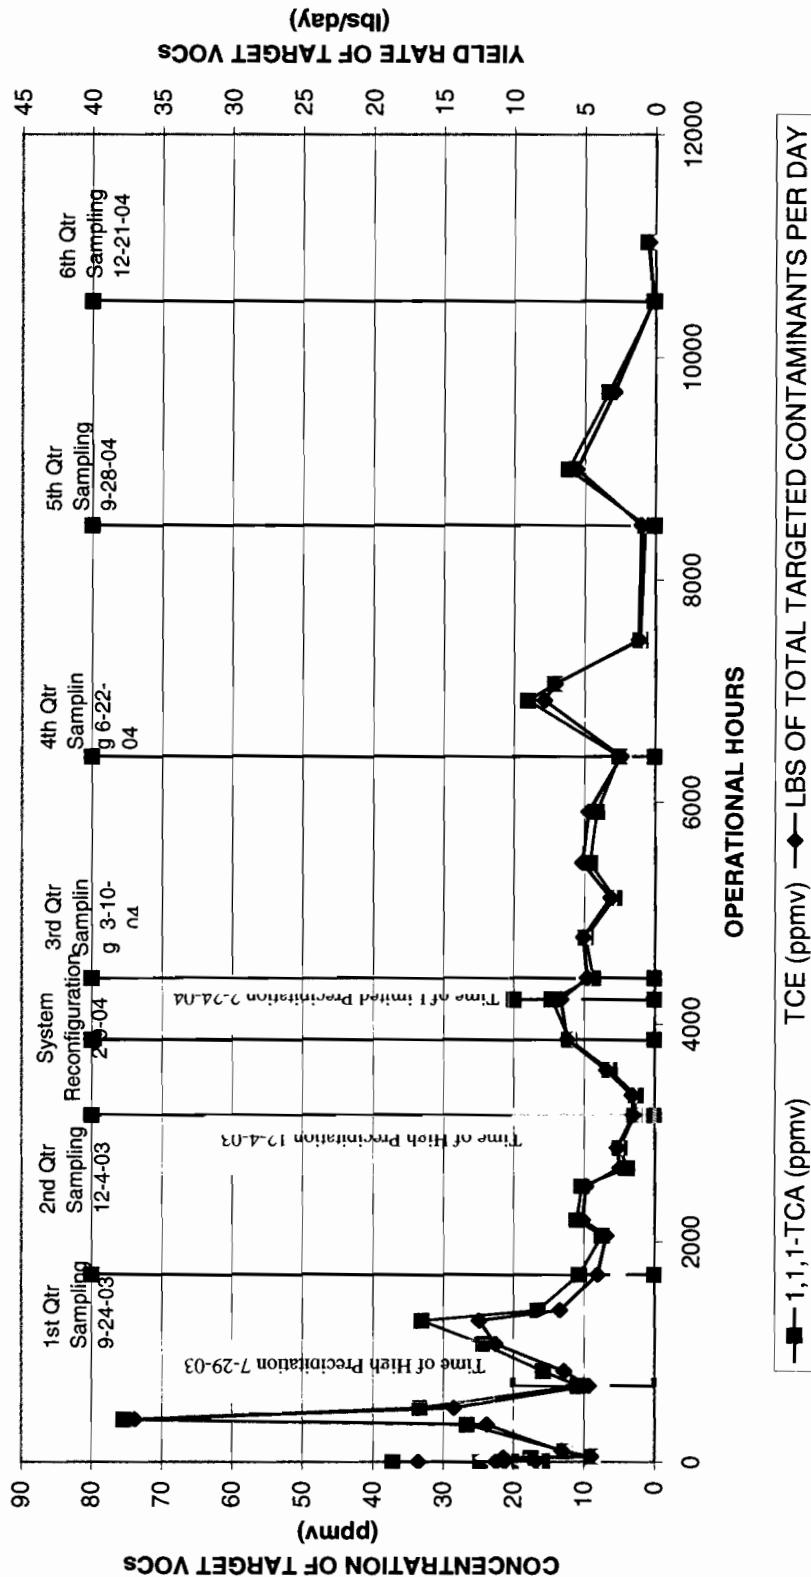

- Continue O&M and monitoring of the SVE System in accordance with the O&M Manual and related documents.
- Interim soil sampling event (based air sample results or need of additional soil contaminate information), early February 2005.
- Continue to evaluate and adjust airflow into the SVE unit.
- Re-allocate the amount of by-pass air as Site conditions allow (wetter weather and decreased Site air temperatures).
- Obtain current copy of the NYSDEC specifications for well abandonment and forward to USACE.
- Continue to work to get data on the well physical and construction characteristics.
- Develop proposal for the proper abandonment of the well.

## **APPENDIX A**

### **Sampling and Analytical Data**

QA/QC Report for Vestal Samples  
(Sample Date: 1/12/05)

**1. Sample Receipt**

The samples arrived at the lab were carefully packed in coolers. All of the sample bags in the coolers arrived intact and the labels on the bags were found to be complete. The information on the sample labels agreed with the information on the chain-of-custody forms placed inside the shipping coolers.

**2. Sample Holding Times**

The required holding times were met according to the lab SOP.

**3. Instrument Blank Analysis**

The instrument blank analysis indicated the instruments did not contain any target compounds.

**4. Lab Duplicate Analysis**

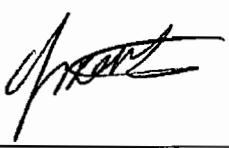

| Vestal Duplicate Sample RPD Report |           |       |       |         |                 |
|------------------------------------|-----------|-------|-------|---------|-----------------|
| Sample ID: VS-SVE-INF-011205-0498  |           |       |       |         |                 |
| Sample Date                        | Analytes  | Data1 | Data2 | RPD (%) | RPD Acceptable? |
| 1/12/05                            | TCE       | 1.073 | 1.037 | 3.4     | YES             |
| 1/12/05                            | 1,1,1-TCA | 1.573 | 1.589 | 1.0     | YES             |

**5. GC Calibrations**

The instruments performed target compound standards calibration check each analysis day, or re-run the standards. The results met the requirement in the lab SOP.

**6. Lab Authentication Statement**

I certify, to the best of my knowledge, that the information in this QA/QC report is true, accurate and complete.

## Appendix B

### Example Calculations Vestal, Area 4

Example: 8/25/03  
1,1,1 TCA (ppm) to 1,1,1 TCA (lbs/day)

0.00000374(conversion constant)\* 24.37(ppm)\* 512(flow)\* 133.4(molecular weight) = 6.23 lbs

Example: 8/12/03 to 8/25/03 "Total Target VOCs'

[6.40 (8/12) + 11.28 (8/25)] / 2 = 8.84 avg. lbs per day for the period  
8.84 (lbs per day) \* 10.19 (days) = 90.08 pounds per reporting period

Calculated Flow Rate:

Vacuum Pressure (inches Hg) = 6

Blower Speed (RPM) = 2000

Temperature (degrees F) = 72

Elevation = 1200 feet

Based on proprietary Roots, Inc flow rate software for Roots 68 blower,  
the CFM for these parameters is 512 on 8/25/03
