Attention: Mr. Raymond Schembri, P.E.

RE: August Monthly Progress Report
Contract # DACA41-01-D-001-0006
Vestal Wellfield 1-1, Area 4, Vestal, New York

Sirs:

Enclosed is the August Monthly Progress Report for the referenced contract. This report covers system operations from 15 August 2005 through 31 August 2005. Start-up, O&M activities for the period as well as sampling activities are summarized in this report. Copies of the analytical data are included. This system was restarted on 15 August after being shutdown on 10 June due to funding considerations. The activity in this report covers the 16 operational days in August 2005.

Please email me at cmarshall@sevensonphilly.com or call at 610-388-0721 if you've any questions.

Sincerely,
Sevenson Environmental Services, Inc.

Cassandra T. Marshall
Project Manager

1.0 INTRODUCTION

Envirogen/Shaw E&I, Inc. has prepared this Monthly Progress Report for the operation of the Soil Vapor Extraction System (SVE system or System) for the Vestal Well 1-1 Superfund Site, Area 4 in Vestal, NY. This report was prepared under a subcontract to Sevenson Environmental Services, Inc, under contract DACA41-01-D-0001-0006. Sevenson's remedial action work is under supervision of the U.S. Environmental Protection Agency (USEPA) and the U.S. Army Corps of Engineers (USACE).

Figure 1 is a Site plan showing the SVE System treatment area, comprised of Cells 1 and 2 and other major components of the System. Construction of the SVE System began in early April and was completed in late June 2003. Start-up of the SVE System began on June 23, 2003. The SVE System is operated in accordance the Final Design documents, O&M Manual and subsequent correspondence with the USEPA and USACE. This report covers the time from August 1 to August 31, 2005.

Section 2.0 of this report summarizes general activities conducted during the reporting period. Section 3.0 summarizes System monitoring and adjustments. Section 4.0 discusses volatile organic compound (VOC) contaminant yields based on process air analytical data and flow rates. Section 5.0 discusses problems encountered during the reporting period and their respective corrective measures. Section 6.0 lists anticipated future activities.

2.0 SUMMARY OF ACTIVITIES CONDUCTED DURING THE REPORTING PERIOD

After system shutdown on 10 June 2005 due to lack of funds, the Vestal SVE system was successfully restarted on 15 August.

Sevenson's contract was successfully modified to add additional operating funds for this contract. Work began immediately to develop the addendum to the Sampling and Analysis Plan to cover the Groundwater Sampling Event and the Seep Sampling Event. Both addenda were complete and approved as of 31 August 2005.

The monthly O&M inspection was performed on August 31, 2005. Airflow, pressure/vacuum, and PID readings were measured throughout the System on August 31, 2005. Process air sampling of the System (influent, mid-carbon and effluent) was performed on August 31, 2005.

The SVE System at the Vestal Area 4 Site ran approximately 16 days without incident during the period 8/15/05 to 8/31/05.

Physical monitoring of the System parameters, such as vacuum/pressure, temperature,

PID readings, and air flow measurements, along with routine maintenance of the System, was conducted during the August reporting period in accordance with the O&M Manual. These O&M measurements and site activities were recorded on daily O&M logs, which are available on-site.

The System was operational approximately 16 days from August 1 to August 31, 2005. This brings the total operational time to approximately 613 days since the June 23, 2003 start-up.

3.0 SVE SYSTEM MONITORING AND ADJUSTMENTS

This section summarizes monitoring of and adjustments to the SVE System during the reporting period. Monitoring of the System included pressure/vacuum and temperature measurements, air flow measurements, and process air sampling and associated VOC analysis. The locations of the SVE wells are illustrated in Figure 1. System parameters were recorded on O&M daily log sheets, available on-site. The chain-of-custody forms and laboratory data summary sheets are provided in Appendix A. All monitoring and/or adjustments were performed in accordance with the O&M Manual.

3.1 Process Air Flows

This section discusses process air flow measurements and balancing throughout the entire System and for the individual SVE wells. Individual SVE withdrawal and injection well process airflow measurements and PID readings were taken on August 31 and are provided in Table 1.

3.1.1 Total System Process Air Flow

During the reporting period, airflow throughout the entire System was measured as outlined in the O&M Manual. The airflow through the System was calculated by measuring amount of vacuum, temperature, speed of the SVE blower, elevation, then using these values to obtain the air flow from the blower curve computer model supplied by the manufacturer (Roots Inc.). Based on this data, the calculated airflow through the entire System on August 31, 2005 averaged 512 cubic feet per minute (cfm). This data is shown in Appendix B. The bypass airflow for August 2005 was approximately 210 scfm.

3.1.2 SVE Well Process Air Flow

Individual SVE withdrawal well process airflow measurements were recorded on August 31, 2005. In addition, PID readings were recorded when process air samples were taken. During the August 31, 2005 System sampling event, PID readings were also taken on the individual SVE withdrawal wells. This data is contained in Table 1.

3.2 Process Air VOC Concentrations

Process air samples were collected during the reporting period on August 31, 2005. Samples were collected and analyzed in accordance with the O&M Manual. The system process air analytical results are contained in Appendix A.

4.0 VOC YIELD

This section details the System VOC yield based on System sampling events performed during the August 1 to August 31, 2005 reporting period. Discussed in this section is the estimated Total Targeted Contaminant (TTC) VOC yield, based on the airflow through the blowers and the composite/total system VOC analytical results. Table 2 shows the total target contaminant yield for each sampling period.

4.1 Total System VOC Yield

The total System VOC yield was calculated using the total system airflow rates and contaminant concentrations. Cumulative system contaminant yields for the reporting period are shown in Table 3. Based on these calculations, the System yielded approximately 29.76 pounds of VOCs from June 8, 2005 to August 31, 2005. The average yield rate of the System per operational day between August 15, 2005 and August 31, 2005 is 1.86 lbs/day. TCE constitutes approximately 6 percent and 1, 1, 1-TCA approximately 94 percent of the total VOC yield over the reporting period. The total TTC yield from start-up (June 23, 2003) to August 31, 2005 is 2,105.40 pounds. The mass of TTC VOCs removed from the treatment area is illustrated in Figure 2. The cumulative contaminant yield is calculated utilizing the data and formulas found in Appendix B. Figure 3 graphically depicts cumulative yield over system operational time. As noted in the SVE System analytical data, the percent concentration of TCE within the influent process air is 45 percent and the concentration of 1,1,1-TCA is 55 percent from startup to August 31, 2005.

5.0 PROBLEMS ENCOUNTERED DURING THE REPORTING PERIOD AND RESPECTIVE CORRECTIVE MEASURES

The System operated well throughout the month of August.

6.0 ANTICIPATED ACTIVITIES

The following activities are anticipated for the next reporting period.

- Mobilize to the site week of 6 September to conduct Interim Sampling Event #2, including both the Deep Sampling at 2 sites (ISB-6 and ISB-8) and the installation of the temporary groundwater well by ISB-5. During this week, we'll also open up the collapsed monitoring well site and conduct the datalogging task to begin formal well closure.

- Return to the site in a week to 10 days of Temporary GW Well installation to sample the well.

- Continue O&M and monitoring of the SVE System in accordance with the O&M Manual and related documents.

- Continue to evaluate and adjust airflow into the SVE unit.

- Re-allocate the amount of by-pass air as Site conditions allow (wetter weather and decreased Site air temperatures).

APPENDIX A
Sampling and Analytical Data

QA/QC Report for Vestal Samples
(Sample Date: 8/31/05)

1. Sample Receipt

The samples arrived at the lab were carefully packed in coolers. All of the sample bags in the coolers arrived intact and the labels on the bags were found to be complete. The information on the sample labels agreed with the information on the chain-of-custody forms placed inside the shipping coolers.

2. Sample Holding Times

The required holding times were met according to the lab SOP.

3. Instrument Blank Analysis

The instrument blank analysis indicated the instruments did not contain any target compounds.

4. Lab Duplicate Analysis

Vestal Duplicate Sample RPD Report					
Sample ID: VS-SVE-MID-083105-0622					
Sample Date	Analytes	Data1	Data2	RPD (%)	RPD Acceptable?
8/31/2005	1,1,1-TCA	0.344	0.36	4.5	YES

5. GC Calibrations

The instruments performed target compound standards calibration check each analysis day, or re-run the standards. The results met the requirement in the lab SOP.

6. Lab Authentication Statement

I certify, to the best of my knowledge, that the information in this QA/QC report is true, accurate and complete.

Appendix B

Example Calculations

Vestal, Area 4

Example: 8/25/03
1,1,1 TCA (ppm) to 1,1,1 TCA (lbs/day)

0.00000374(conversion constant)* 24.37(ppm)* 512(flow)* 133.4(molecular weight) = 6.23 lbs

Example: 8/12/03 to 8/25/03 'Total Target VOCs'

[6.40 (8/12) + 11.28 (8/25)] / 2 = 8.84 avg. lbs per day for the period
8.84 (lbs per day) * 10.19 (days) = 90.08 pounds per reporting period

Calculated Flow Rate:
Vacuum Pressure (inches Hg) = 6
Blower Speed (RPM) = 2000
Temperature (degrees F) = 72
Elevation = 1200 feet
Based on proprietary Roots, Inc flow rate software for Roots 68 blower, the
CFM for these parameters is 512 on 8/25/03
