Subject:

Operational Year 5 Quarter Number 2 Monitoring Report, Colesville Landfill, Broome County, New York. (Site No. 704010). **ENVIRONMENT** 

Dear Mr. Jacob:

On behalf of Broome County, ARCADIS is providing the Operational Year 5 Quarter Number 2 Monitoring Report for the Colesville Landfill, Broome County, New York.

Please feel free to contact me if you have any questions or comments.

Sincerely,

ARCADIS of New York, Inc.

Operational Year 5 Quarter Number 2 Monitoring Report

Colesville Landfill Broome County, New York NYSDEC Site 704010

#### 1. Introduction

This Monitoring Report (Report) was prepared on behalf of the Broome County Division of Solid Waste Management for the Colesville Landfill, located in Broome County, New York (site) to evaluate and document long-term monitoring (LTM) activities at the site. Remediation and monitoring activities are being conducted pursuant to the Record of Decision (ROD) and Explanation of Significant Difference (ESD) that were issued in March 1991 and September 2000, respectively. LTM activities (which include environmental effectiveness and remediation system performance monitoring) were performed in accordance with the LTM Plan (ARCADIS G&M, Inc. 2002), LTM Plan Addendum for Spring Water Remediation Systems (ARCADIS 2003), and Interim Remedial Action Report (ARCADIS 2004), which were approved by the United States Environmental Protection Agency (USEPA) and New York State Department of Environmental Conservation (NYSDEC). These documents provide a detailed description of the LTM program, methodology, and rationale. Where applicable these elements are either summarized or incorporated by reference herein.

This report describes the results of the March 2007 groundwater quality monitoring event conducted during Operational Year 5, Quarter Number 2. A description of the operation, maintenance, and monitoring (OM&M) associated with the Groundwater Remediation System from December 2007 through March 2007 has also been included. In addition, this report describes SP-5 Spring Water Remediation System OM&M activities conducted during this quarter. Following the detailed data analysis and discussion is a summary of findings, conclusions, and recommendations.

As referenced in previous monitoring reports (ARCADIS 2007), damage occurred at the former SP-4 spring area and at recovery well GMPW-5 as a result of flooding of the North Stream. Further discussion of the flood damage is provided herein when applicable to the LTM program and/or OM&M of the Groundwater Remediation System. Repair of the damaged components will be discussed in future Monitoring Reports.

# 2. Methodology

The following section provides a summary of the environmental effectiveness and remedial system performance monitoring methodology for Operational Year 5, Quarter Number 2. A site plan, which shows the location of environmental effectiveness monitoring, is provided on Figure 1.

Operational Year 5 Quarter Number 2 Monitoring Report

Colesville Landfill Broome County, New York NYSDEC Site 704010

#### 2.1 Environmental Effectiveness Monitoring

The environmental effectiveness monitoring performed during Operational Year 5, Quarter Number 2 included the following:

- Water-level (hydraulic) measurements were collected from 20 monitoring wells on March 26, 2007.
- Groundwater samples were collected from five monitoring wells (Year 5, Q2 list of wells) during the week of March 26, 2007 and were selectively analyzed for volatile organic compounds (VOCs) and select inorganic parameters. Field parameters were also recorded at these monitoring locations.
- Samples (VOCs only) were collected at the SP-4 and F-6 surface water locations on March 27, 2007.

In accordance with the Proposed Modifications to the Long-Term Monitoring Program (ARCADIS 2005), groundwater samples were collected from monitoring wells utilizing passive diffusive bag (PDB) samplers.

### 2.2 Groundwater Remediation System Performance Monitoring

Groundwater Remediation System performance monitoring activities during Operational Year 5, Quarter Number 2 were as follows:

- Pump-and-treat (PT) system recovery well influent and effluent samples were collected on March 9, 2007. The samples were selectively analyzed for VOCs and total iron.
- One vapor sample from the PT system air stripper effluent was collected on March 9, 2007. The sample was analyzed for VOCs.
- PT system operating parameters were recorded during the quarterly OM&M site visit.
- Total Organic Carbon (TOC) samples were collected from select injection wells on March 27, 2007.

Operational Year 5 Quarter Number 2 Monitoring Report

Colesville Landfill Broome County, New York NYSDEC Site 704010

 Automated reagent injection (ARI) system operating parameters were recorded during each injection event.

PT system groundwater samples were collected as grab samples directly from the individual recovery pipelines connected to recovery wells GMPW-3, GMPW-4, GMPW-5 the combined influent water to the low profile air stripper, and the combined effluent after the cartridge filters. The effluent air sample was collected as a grab sample directly from the designated point located on the low profile air stripper stack.

# 2.3 Spring Water Remediation System Performance Monitoring

SP-5 Spring Water Remediation System OM&M could not be conducted during Operational Year 5, Quarter Number 2 due to clogging of the SP-5 effluent riprap infiltration zone. Maintenance has been scheduled to be conducted in parallel with maintenance of the former SP-4 spring area (see Section 12 below).

#### 3. Groundwater Flow

Water-level measurements were made from existing wells on March 26, 2007. Water-level elevation data for Operational Year 5, Quarter Number 2 is provided in Table 1. In summary, the groundwater flow direction in the project area (i.e., adjacent to the landfill western perimeter) and site-wide in the Operational Year 5, Quarter Number 2 round was consistent with previous rounds. The groundwater flow direction in the project area is toward the southwest from the western perimeter of the landfill. The groundwater flow direction in areas further to the east of the project area is toward the south/southwest.

# 4. Groundwater Quality

The following sections describe the analytical results for groundwater samples collected during the March 2007 monitoring round (Operational Year 5, Quarter Number 2). Groundwater analytical results are provided in Tables 2 and 3. Where applicable, the previous round of analytical results for the respective sampling location has been provided in the same table for comparative purposes.

# 4.1 Volatile Organic Compounds

As shown in Table 2, total VOC (TVOC) concentrations in all monitoring wells sampled during the reporting period were consistent with prior data. Specifically, monitoring well

Operational Year 5 Quarter Number 2 Monitoring Report

Colesville Landfill Broome County, New York NYSDEC Site 704010

GMMW-5, which is located closest to the IRZ, remained stable at a TVOC concentration of 196.2 micrograms per liter (ug/L) during the current reporting period. Similarly, TVOC concentrations in mid-plume monitoring wells PW-4, W-5, GMMW-2, and GMMW-6 remained stable at 59.7ug/L, 215.2 ug/L, 325.6 ug/L, and 519.6 ug/L respectively.

PT system analytical VOC results are provided in Table 5. During the current reporting period, the TVOC concentration at recovery wells GMPW-3 and GMPW-4 were consistent with prior rounds of data. Specifically, TVOC concentrations in recovery wells GMPW-3 and GMPW-4 were 276.5 ug/L and 399.6 ug/L, respectively. The TVOC concentration at recovery well GMPW-5 remained at 0.0 ug/L. A complete evaluation of performance monitoring conducted on the PT system is provided in Section 8.1.2 of this report.

#### 4.2 Indicators of Reducing Conditions

Groundwater analytical results for biogeochemical parameters and field parameters were collected in accordance with the LTM plan and are provided in Table 2. In summary, field and laboratory groundwater data for Wells GMMW-5 and GMMW-6 indicate that strongly reducing conditions are being maintained within the IRZ. This is evidenced by the presence of reduced forms of alternate electron acceptors (i.e., methane). Further details of the ARI system performance monitoring are provided in Section 8.2.2 of this report.

# 4.3 Evidence of Biodegradation

Table 2 provides the results of biodegradation end product concentrations in monitoring wells and indicates the continued occurrence of bioactivity and biodegradation of VOCs within the IRZ. Specifically, the concentration of ethene and ethane within monitoring wells GMMW-5 and GMMW-6 continue to be elevated when compared to baseline conditions. Additional details on the results of biogeochemical monitoring as evidence of Groundwater Remediation System performance and effectiveness are discussed in Section 8.2.2 of this report.

#### 5. Spring Water Quality

Spring water samples from the SP-2 and SP-3 spring water locations were not collected during the Operational Year 5, Quarter Number 2 period due to construction

Operational Year 5 Quarter Number 2 Monitoring Report

Colesville Landfill Broome County, New York NYSDEC Site 704010

activities being conducted in response to the flood damage along North Stream. Further details regarding the flood damage related activities is provided in Section 7.

# 6. Surface Water Quality

Surface water quality analytical results for the Operational Year 5, Quarter Number 2 monitoring round are summarized in Table 1. As shown in Table 1, surface water quality at the F-6 and SP-4 sampling locations remains consistent with prior rounds of analytical data. Specifically, TVOC concentrations at the F-6 and SP-4 sampling locations were below the limits of detection at both sampling locations.

#### 7. Status of Flood Related Damages

As referenced in the previous monitoring reports, damage was incurred to the former SP-4 spring location and recovery well GMPW-5 as a result of flooding of the North Stream. In addition, the traditionally sampled spring locations (e.g., the SP-2 and SP-3 spring sampling locations) were made inaccessible as a result of dangerous conditions (e.g., unstable side slopes, fallen trees, etc.) along the North Stream.

During the current reporting period, the following actions were taken:

- > Broome County completed the stabilization of the landfill side-slopes adjacent to the North Stream.
- ➢ ARCADIS conducted a second visual inspection of the SP-2 and SP-3 spring locations during the week of March 27, 2007. It was noted that the SP-2 and SP-3 springs could not be located any longer following the stabilization of the landfill side-slopes. However, several small areas of ponding were noted between the stream and the stabilized landfill slope. ARCADIS will re-inspect these areas during the Operational Year 5, Quarter Number 3 monitoring event to assess if the ponding is a result of snow melt or the generation of new springs.
- A subcontractor was contracted for restoration of the former SP-4 spring area and maintenance of the SP-5 remediation system. Work is anticipated to begin during the following operational quarter.

Operational Year 5 Quarter Number 2 Monitoring Report

Colesville Landfill Broome County, New York NYSDEC Site 704010

# 8. Groundwater Remediation System Performance

The following section describes the results of the Groundwater Remediation System performance monitoring conducted during Operational Year 5, Quarter Number 2.

#### 8.1 PT System

The following section describes the results of the PT system performance monitoring conducted during Operational Year 5, Quarter Number 2.

## 8.1.1 Summary of Operation, Maintenance, and Monitoring

During Operational Year 5, Quarter Number 2, the PT system operated continuously until approximately February 18, 2007. On February 18 (or there about), the system shut down due to freezing conditions within the treatment building which resulted in the damage of several system appurtenances (e.g., valves, flowmeters, pump heads, etc.). The PT system was repaired between March 7 and March 9, 2007 and was subsequently restarted on March 9, 2007.

PT system OM&M for Operational Year 5, Quarter Number 2 was conducted during the system repairs between March 7 and March 9, 2007 and included operation and maintenance of system equipment, the collection of system performance samples (water and vapor), and recording system operating parameters. Table 4 provides a summary of the recorded system operating parameters for the current operating period. As shown in Table 4, the total effluent groundwater recovery rate for Operational Year 5, Quarter Number 2 was approximately 0.53-gallon per minute (gpm), with individual recovery rates of 0.41-gpm, 0.07-gpm, and 0.06-gpm in GMPW-3, GMPW-4, and GMPW-5, respectively. The average individual recovery well rate in recovery well GMPW-3 increased to near startup conditions during Operational Year 5, Quarter Number 2. This was most likely a direct result of the pump replacement which was completed during Operation Year 5, Quarter Number 1. The average recovery rate in recovery wells GMPW-4 and GMPW-5 were slightly lower when compared to previous operation. The decrease in recovery rate was most likely due to the system down time caused by the freezing conditions and associated maintenance activities.

A total of 76,993 gallons of groundwater was recovered during Operational Year 5, Quarter Number 2 and a total of 1,252,823 gallons of groundwater has been recovered since system startup. The low profile air stripper operated in accordance with the design specifications but the blower flowrate was not recorded due to a malfunctioning

Operational Year 5 Quarter Number 2 Monitoring Report

Colesville Landfill Broome County, New York NYSDEC Site 704010

measuring device. However, the blower discharge pressure was 8.9 inches of water (IWC), which is within the limits for normal system operation.

#### 8.1.2 Results of Performance Sampling

PT system performance sampling for Operational Year 5, Quarter Number 2 was conducted on March 9, 2007. As discussed previously, five groundwater samples and one vapor sample were collected. Groundwater samples included collection of individual recovery well samples (GMPW-3, GMPW-4, and GMPW-5), total influent, and total effluent after the cartridge filters. The vapor sample was collected from the effluent stack of the low profile air stripper.

Table 5 provides a summary of the PT system performance groundwater sampling analytical results. As shown in Table 5, all groundwater VOCs were treated to below their respective Best Professional Judgment (BPJ) limits via the low profile air stripper with the exception of m,p-xylene, which was detected slightly above its BPJ limit. The total iron concentration after the cartridge filter was below the respective recommended daily average BPJ limit. Based on the total groundwater recovered during the reporting period and total influent groundwater concentration, an estimated 0.17 pounds (lbs) of VOC mass were removed from the subsurface during the quarterly reporting period, as shown in Table 6. A total of approximately 2.30 lbs of VOCs have been removed from the subsurface since system startup.

Table 7 provides a summary of the PT system performance vapor sampling analytical results. As shown in Table 7, VOCs were not detected above their respective detection limits with the exception of m,p-xylene (56 ppbv). To be conservative, a NYSDEC DAR-1 air model was calculated using the actual analytical data for detected constituents or the detection limit of all constituents, which were not detected but have historically been detected in the influent groundwater. All COCs were below their respective short-term guidance concentrations (SGCs) and annual guidance concentrations (AGCs). Appendix B contains the NYSDEC DAR-1 AGC screening simulation based on the hand calculations provided in the NYSDEC DAR-1 AGC/SGC tables dated December 22, 2003.

#### 8.2 ARI System

The following section describes the results of the ARI system performance monitoring conducted during Operational Year 5, Quarter Number 2.

Operational Year 5 Quarter Number 2 Monitoring Report

Colesville Landfill Broome County, New York NYSDEC Site 704010

#### 8.2.1 Summary of Operation, Maintenance, and Monitoring

ARI system OM&M was conducted during the Operational Year 5, Quarter Number 2 OM&M site visit during the week of March 27, 2007 and included operation and maintenance of system equipment and the collection of samples for analysis of TOC from injection wells IW-3, IW-9, and IW-13. As described in the Hydraulic Injection Test and Alternate Electron Donor Pilot Test Letter Work Plan (ARCADIS 2006), alternate electron donor pilot test reagent injections were completed during the week of December 18, 2007. The reagent injection letter work plan was approved by the NYSDEC on December 8, 2006. Therefore, a full-scale reagent injection was not conducted during the current reporting period. A summary of the pilot test methodology and results will be provided following completion of the pilot test post-injection monitoring period. It is anticipated that the post-injection monitoring period will be completed during the first quarter of 2008 (e.g., during the Operational Year 6, Quarter Number 2 monitoring period).

#### 8.2.2 Results of Performance Sampling

ARI system performance sampling was conducted on March 27, 2007. As discussed previously, this event consisted of obtaining TOC samples at three injection wells. In addition, analytical results from select monitoring wells under the environmental effectiveness monitoring program were utilized to determine the effectiveness of the ARI system. A summary of key observations is as follows:

- The TOC concentration at monitoring well GMMW-5 (96.4 mg/L), and injection wells IW-3 (32.5 mg/L), IW-8 (426 mg/L), and IW-13 (13 mg/L) indicate that sufficient organic carbon remained in the subsurface to maintain the IRZ.
- The methane concentration in monitoring wells GMMW-5 and GMMW-6 remained significantly elevated at 29,000 micrograms per liter (ug/L) and 1,800 ug/L, respectively. These data provide evidence that strongly reducing conditions (methanogenic) are being maintained within the IRZ.

 The ethene concentration in monitoring wells GMMW-5 and GMMW-6 remained elevated at 6,200 nanograms per liter (ng/L) and 100,000 ng/L, respectively.

Operational Year 5 Quarter Number 2 Monitoring Report

Colesville Landfill Broome County, New York NYSDEC Site 704010

- Similarly, the ethane concentration in monitoring wells GMMW-5 and GMMW-6 remained elevated at 20,000 nanograms per liter (ng/L) and 4,800 ng/L, respectively.
- TVOC concentrations remained stable but significantly lower than baseline conditions in monitoring wells GMMW-5 and GMMW-6.

## 9. Spring Water Remediation System Performance

As referenced previously, SP-5 Spring Water Remediation System OM&M could not be conducted during Operational Year 5, Quarter Number 2 due to clogging of the SP-5 effluent riprap infiltration zone. Maintenance has been scheduled to be conducted in parallel with maintenance to the former SP-4 spring area.

#### 10. Conclusions

Based on the data obtained from the Operational Year 5, Quarter Number 2 monitoring, ARCADIS concludes the following:

- The anaerobic IRZ established downgradient of the injection transect is successfully reducing the concentration of site-related VOCs through enhanced reductive dechlorination.
- The pumping rate of recovery well GMPW-3 was similar to startup conditions indicating that the replacement of the recovery pump may have resolved the recent decline in observed pumping rate.
- Despite being down temporarily due to freezing of several system components, the PT system is operating as designed and is treating recovered groundwater VOCs to below BPJ limits prior to discharge.
- Broome County completed the stabilization of the landfill side-slopes adjacent to the North Stream.
- A subcontractor was contracted for restoration of the former SP-4 spring area and maintenance of the SP-5 remediation system. Work is anticipated to begin during the following operational quarter; and,

Operational Year 5 Quarter Number 2 Monitoring Report

Colesville Landfill Broome County, New York NYSDEC Site 704010

 Surface water quality continues to be consistent with historical data indicating that impacted groundwater and/or flood related damages are not causing an adverse impact to surface water along the North Stream.

#### 11. Recommendations

The following recommendations are made for Operational Year 5, Quarter Number 3 activities:

- Re-inspect the SP-2 and SP-3 spring locations and areas of ponding noted during Operational Year 5, Quarter Number 2.
- Continue to operate the ARI system without injection well IW-8. Obtain and evaluate data related to the ongoing alternate electron donor pilot program.
- Continue to evaluate the performance of recovery well GMPW-5 to determine
  if the observed decrease during the current reporting period was a result of
  system down time caused by freezing conditions.
- · Perform maintenance of the former SP-4 spring area; and,
- Perform maintenance of the SP-5 spring water remediation system while mobilized for maintenance of the former SP-4 spring area.

# 12. Project Schedule

Groundwater environmental effectiveness monitoring is scheduled to be conducted for Operational Year 5 on the quarterly schedule set forth in the Proposed Modifications to Long-Term Monitoring Program (ARCADIS 2005). System OM&M of the Groundwater Remediation System will continue to be performed on a quarterly basis consistent with the LTM Plan. Maintenance of the SP-5 spring water remediation system will be completed concurrently with maintenance activities for the former SP-4 spring location. It is anticipated that these repairs will be completed during Operational Year 5, Quarter Number 3. Repair status of the damaged remedial components will be documented in future Monitoring Reports and through interim correspondence with the NYSDEC and USEPA.

Not measured. MN gpm

Inches of water column. Gallons per minute. i.w.c.

Standard cubic feet per minute.

Notes:

The total effluent totalizer was damaged as a result of freezing. Accordingly, the average daily flowrate and total groundwater recovered were calculated by summing the the values recorded/calculated from the individual recovery wells.

The water bypass totalizer was damaged as a result of freezing.

GMPW-4 totalizing flow meter malfuctioned and was replaced on 12/23/2005. **ત** હ

fps: feet per second acfm: actual cubic feet per minute ug/m³: micrograms per cubic meter lb/yr: pounds per year lb/hr: pounds per hour ppb: parts per billion

# Notes/Assumptions:

- 1. Stack temperature was inadvertantely not recorded during the current reporting period. Accordingly, a stack discharge temperature of 60°F was used based on historical recorded parameters.
- 2. The ambient temperature is approximately 24°F based on recorded conditions.
- Calculations assume that the system will run with the maximum allowable concentrations between quarteny readings.
- 4. AGC refers to the Annual Guideline Concentration as determined using the hand calculations in the DAR-1 AGC/SGC Tables dated December 22, 2003. 5. To be conservative the lower detection limit was used for compounds that were below the limit of detection, but are found in the influent
  - groundwater of the Groundwater Remediation System.

Table B-2. NYSDEC DAR-1 Air Modeling Data, Operational Year 5, Quarter Number 2, Colesville Landfill, Broome County, New York.

ug/m³: Micrograms per cubic meter

ppb: parts per billion

\*: Analyte concentration below detection limit, detection limit was used in calculations

lb/hr: pounds per hour

-: No SGC listed for compound

NA: Not applicable

## iotes:

- DAR-1 refers to DAR-1 AGC/SGC Tables dated December 22, 2003.
- 2. SGC refers to the Short-Term Guideline Concentration as determined using the hand calculations in the DAR-1 AGC/SGC Tables dated December 22, 2003.
  - To be conservative the lower detection limit was used for compounds that were below the limit of detection, but are found in the influent groundwater of the Groundwater Remediation System.
