**Subject: Southern Boundary Well Installation Report
Radian International Project No. 80186505.05**

Dear Mr. Pratt:

The following letter report summarizes the recently completed monitoring well installation field activities as outlined in the Southern Property Line Well Cluster Work Plan submitted to you on 23 September, 1998. This work was performed in response to requests by the New York State Department of Environmental Conservation (NYSDEC) for installation of an additional downgradient well cluster as noted in the NYSDEC's 2 October 1998 correspondence.

1.0 INTRODUCTION

Two monitoring wells were installed at the southern boundary of the Erdle Perforating property as shown in Figure 1. The purpose of the monitoring wells was to define the nature and extent of potentially impacted groundwater at the property boundary and to determine the potential for off site migration of impacted groundwater. Gaining access to the locations of MW-7 and MW-7D was difficult. Access to the proposed well locations as shown in the work plan was complicated by the low topographic elevation along the southern property boundary and the presence of ponded surface water.

2.0 MONITORING WELL CLUSTER INSTALLATION

Monitoring well MW-7 was installed at the location as shown in Figure 1. The boring for MW-7 was completed using 8.25 inch inside diameter hollow stem augers. Soils samples were collected continuously from the ground surface to the bottom of the borehole to determine lithology. Samples were obtained using a split barrel sampler driven with a 130 lb. hammer according to ASTM- D1586. Soil samples obtained were logged and classified according to the Unified Soils Classification System (USCS) (Attachment A). In addition each sample was screened with a photoionization detector (PID) for the presence of volatile organic compounds. The boring was terminated at approximately 14.5' below ground surface (bgs) when bedrock was encountered. The monitoring well was installed through the augers. The well materials consisted of 2-inch inside diameter (ID) schedule 40 poly vinyl chloride (PVC) well screen (.010 slot) and riser pipe. The well screen was installed from 4 ft. to 14 ft. bgs. After screen and riser pipe installation in the borehole the remaining annular space was backfilled with No. 2 Morie sand from 14.5 ft. to 3 ft. bgs. A bentonite pellet seal was installed from 3 ft. to 1 ft. bgs. The remaining borehole annulus was backfilled with a bentonite cement grout. A locking protective casing was installed over the

Mr. David Pratt
NYSDEC
21 December 1998
Page 2

PVC riser pipe. In addition a 2' diameter concrete pad was installed at the ground surface around the well. Well construction diagrams are provided in Attachment A.

Monitoring well MW-7 D was installed approximately 10 ft. from the location of MW-7 as shown in Figure 1. The boring for MW-7D was advanced utilizing 12" ID hollow stem augers and water rotary drilling methods. Initially the borehole was advanced with the hollow stem augers to a depth of 14.5 ft. bgs. The augers were left in the ground while the bedrock was reamed with a 10" diameter roller bit. The borehole was advanced to a depth of 17.5 ft. bgs. Subsequently a 6" ID steel casing was intalled into the borehole. The annulus between the augers and the steel casing was backfilled with a cement bentonite mixture. The augers were removed from the ground. The cement was permitted to cure for a period of 24 hours before resuming drilling activities. The bedrock at MW-7D was subsequently drilled to a depth of 25 ft. bgs with a 5 5/8-inch diameter roller bit. The well was completed as an open borehole monitoring well with the open portion of the borehole from 17.5 ft. bgs to 25 ft. bgs. The boring log and well construction diagram are presented in Attachment A.

3.0 WELL DEVELOPMENT

Each monitoring well was developed of approximately 24 hours following completion of well installation activities. Wells were developed by alternating surging activities with pumping or bailing activities. The goal of development was to develop the well until the following objectives were met:

1. The turbidity remains within a 10 nephelometric turbidity unit (NTU) range for at least a period of 30 minutes.
2. The pH, conductivity and temperature have stabilized for at least three sets of measurements.
3. Documentation of discharge water and volume.
4. Develop until no sediment remains in the well.
5. Use of additives is not permitted.
6. All development equipment shall be decontaminated prior and after use.
7. A goal of 50 NTUs for development discharge water.

Monitoring well MW-7 was installed within the unconsolidated glacial material. Ten well volumes were removed from the well, however the NYSDEC criteria of 50 NTUs for the purge water could not be attained. Two factors are primarily responsible for this condition, the very fine grain size constituting a majority of the aquifer matrix and secondly the very slow recharge conditions.

Monitoring well MW-7D was installed in the dolomite aquifer beneath the glacial till unit at the Erdle site. Ten well volumes were also removed from this monitoring well following completion of well drilling activities. No problems were encountered in attaining well development goals. Well development records are contained in attachment B.

4.0 GROUNDWATER SAMPLING ACTIVITIES

A groundwater sampling event was completed following well installation activities October 29, 1998. Prior to sampling monitoring wells onsite, each well was gauged using an interface probe to check for the

Mr. David Pratt
NYSDEC
21 December 1998
Page 3

presence of Non Aqueous Phase Liquid (NAPL) in each new monitoring well. NAPL was not detected in any of the newly installed groundwater monitoring wells or existing monitoring wells onsite. In addition the water table surface and the bottom of the monitoring well were gauged to determine the height of the water column within the well. Based on these measurements, the volume of water contained within the well casing was calculated prior to purging the respective monitoring well.

Each well was purged using a dedicated Teflon™ bailer. The temperature, pH, specific conductivity temperature and turbidity were measured following removal of each well volume. Groundwater quality parameters measured in the field are presented in Table 1.

Groundwater samples were collected from the newly installed monitoring wells as well as the existing monitoring wells including MW-1D, MW-2D, MW-3D, MW-4D, MW-6 and MW-6D. Samples were collected and placed into pre-preserved sample bottles provided by RECRA Laboratories. Groundwater samples that were collected from the newly installed monitoring wells were placed into coolers and chilled with ice. Samples were sent to RECRA Labnet in Amherst, New York for analysis. Analytical parameters specified for the monitoring wells included Volatile Organic Compounds (VOCs) by EPA method 8010 and 8020.

5.0 GROUNDWATER ANALYTICAL RESULTS

Table 2 presents a summary of quarterly groundwater sample analytical results for monitoring wells sampled at the Erdle Perforating Facility. A total of 5 analytes were detected in monitoring wells included in the quarterly monitoring well network. Analytes detected included 1,1 Dichloroethane, Trans-1,2 Dichlorethane, Trans-1,2 Dichlorethane, Trichlorethene and Vinyl Chloride. Groundwater analytical data are presented in Attachment C.

6.0 CONCLUSIONS

Based on the analytical results from the October 29, 1998 groundwater sampling event (presented in Table 2), the following conclusions can be made regarding the bedrock groundwater conditions at the Erdle Perforating facility:

- Groundwater analytical results from MW-7D indicate that the extent of the groundwater plume is near the southern property boundary at this location;
- Groundwater analytical results from MW-6D and from the two previous sampling events show declining levels of trichloroethylene at concentrations of 1000 µg/L, 320 µg/L, and 290 µg/L, respectively. This trend suggests a declining source load, which may be a result of 2-Phase treatment at the source area.
- Additional observations which are evident when reviewing groundwater analytical results include:
 1. The plume of impacted groundwater diffuses towards the south moving away from the source area (MW-1D).

Mr. David Pratt
NYSDEC
21 December 1998
Page 4

2. The concentration of organic compounds in the bedrock aquifer decreases with distance south of the source indicating one plume.
3. Organic compounds are at low levels near the southern property boundary.

Based on these trends, it is likely that the concentrations in the downgradient monitoring wells will continue to decline. To confirm this, we recommend that quarterly groundwater monitoring events continue on a quarterly basis and additionally continued operation of the 2-Phase Extraction system.

Please do not hesitate to call me or Mr. Jim Ferguson at 412-788-2717 should you have any additional questions regarding the results of this report.

Sincerely,

Gary C. Beswick, CIH
Unit Leader
