Re: Permeable Reactive Wall Pilot Test Results for First Four Sample Rounds,
Essex/Hope Site, Jamestown, NY

Dear Mr. Moore:

Essex Specialty Products, Inc. (ESP) is currently operating a pump and treat system (P&T) at the Essex/Hope site located in Jamestown, NY (Figure 1 and 2). ESP is evaluating alternatives to P&T to expedite site closure and reduce overall project costs. As a part of this evaluation, ESP retained URS Corporation (URS) to evaluate zero valent iron (ZVI) as a possible alternative remedial approach. As a part of this evaluation, URS is currently conducting a zero valent iron pilot test at the site.

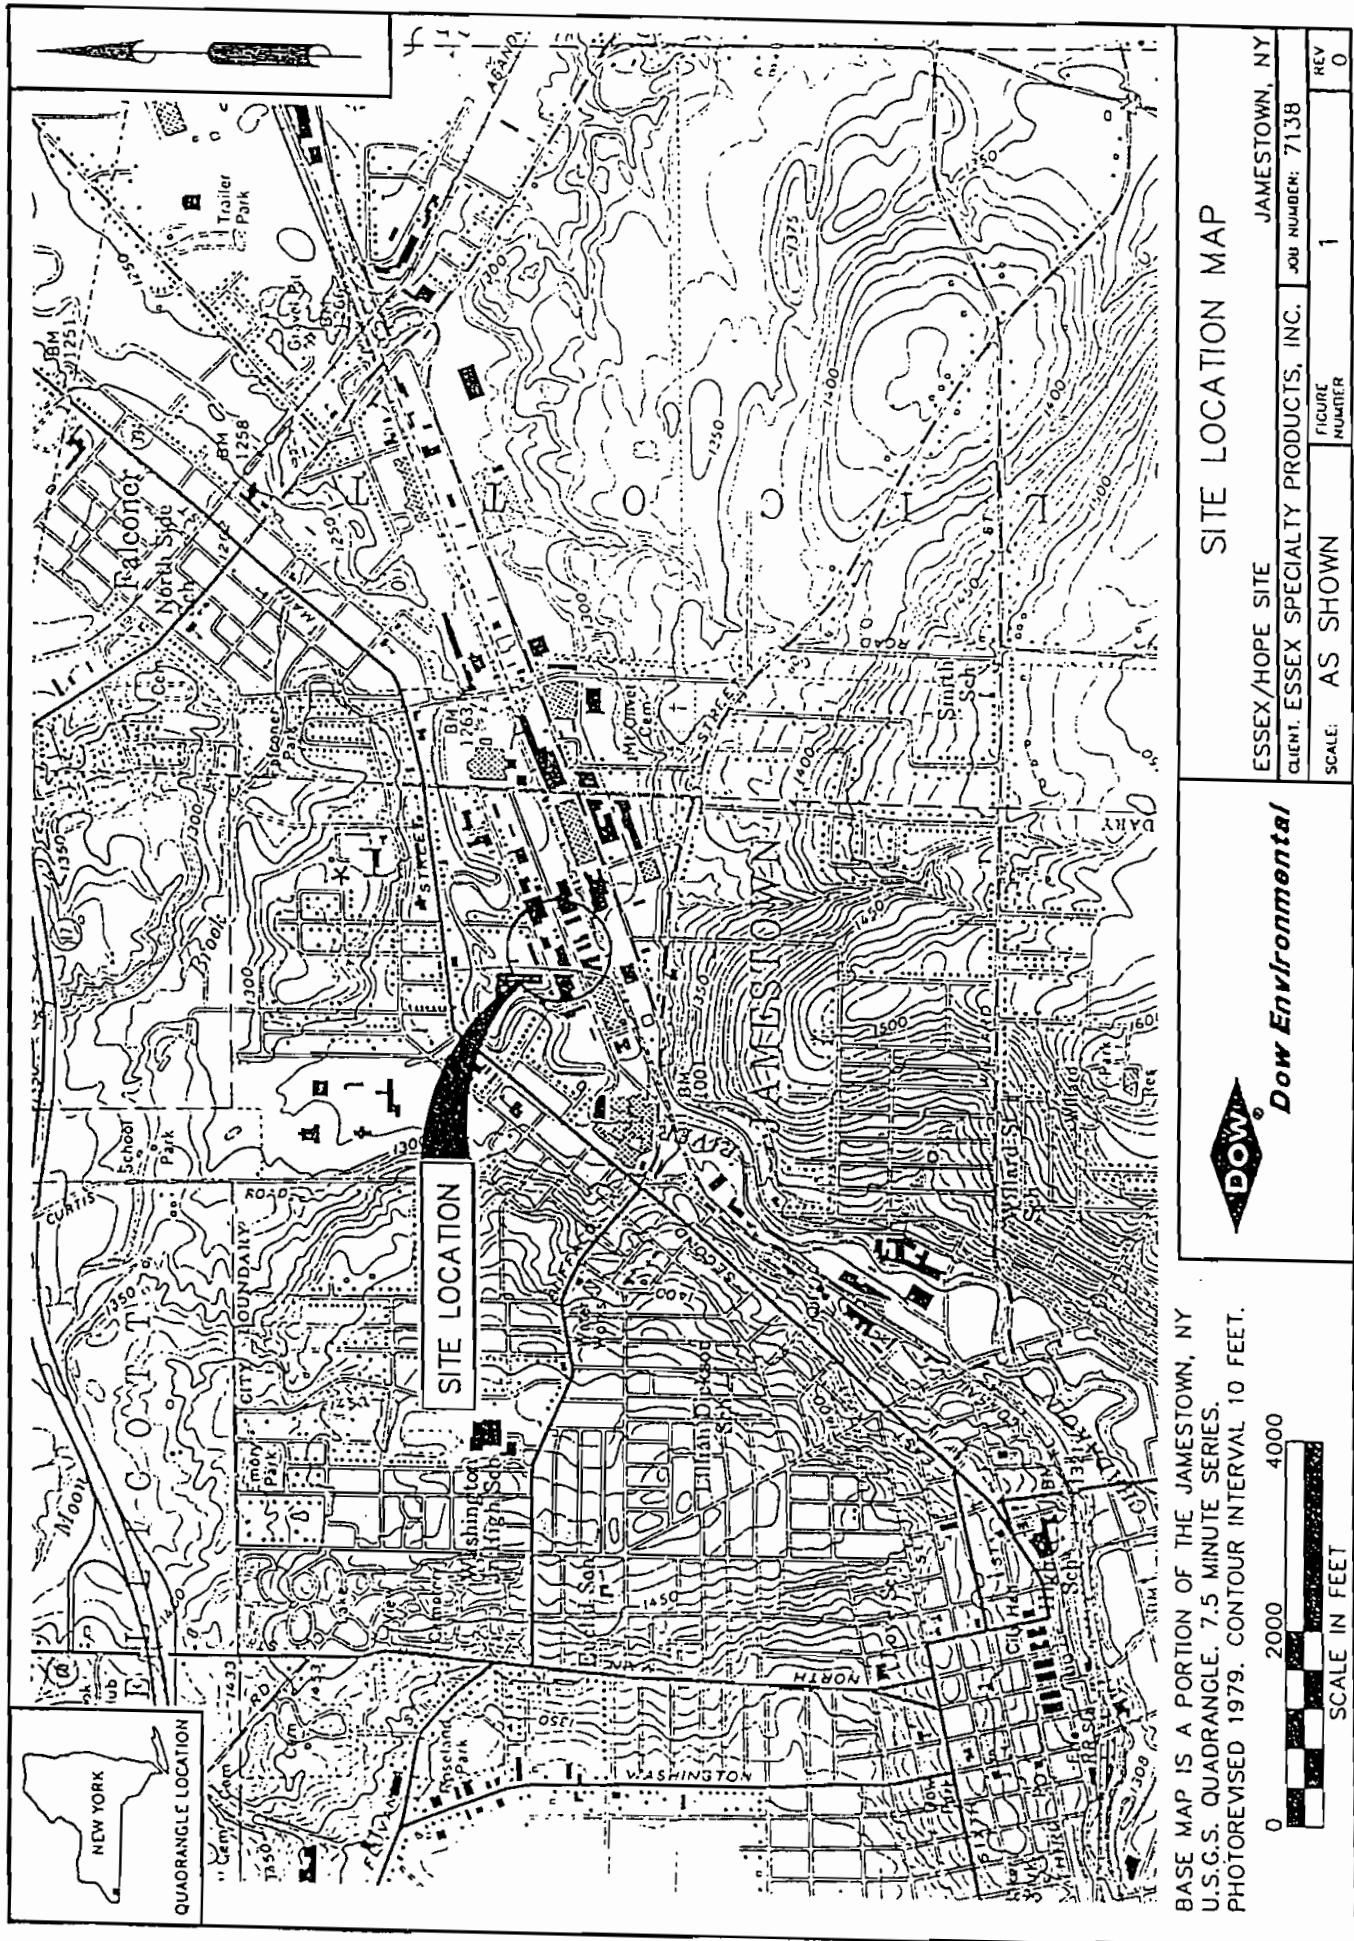

EXECUTIVE SUMMARY

This interim report summarizes the results of roughly the first three months of the ZVI pilot test at the ESP site. The pilot test includes an evaluation of the effectiveness of two ZVI approaches:

1. Permeable reactive wall (PRW), and
2. Source control injections.

These two techniques represent different ZVI remedial approaches to achieve site closure. Generally, the PRW would be a containment approach, while the source injections would focus on source control possibly in conjunction with a monitored natural attenuation program. At this time both options are considered viable.

The PRW portion of the pilot test includes two wall sections, one in the shallow zone and one in the deep zone. Based on the high levels of TCE (367,000 µg/L at PZ-4D) in the deep zone, TCE contamination in the deep zone is the primary focus of remediation at the site. Because of this focus, the source control injection portion of the pilot test is being conducted in the deep zone only.

			DRAWING NO. B8

The results for the first four rounds of groundwater sampling (baseline sampling included) suggest that both ZVI placement methods will be effective in the deep zone. To date, source control injections show the most success. Analytical results indicate that ZVI source injections decreased the levels of trichloroethylene (TCE) between 77.9% and 98.6% over a (roughly) three month period. PRW treatment in the deep zone decreased the levels of TCE between 46.4% and 46.7% in the same period. There were negligible changes in TCE levels observed in the shallow zone. Since we are seeing negligible changes in the level of TCE in the shallow zone we are evaluating the data to determine the possible causes.

PILOT TEST DATA EVALUATION

The pilot test data fall into three distinct groups that can be used to evaluate the ZVI performance:

1. Water Quality
2. Volatile Organic Compound (VOC)
3. Groundwater Hydraulics (groundwater gradients, velocities, and flow paths)

These three data sets are discussed below.

Water Quality Results

The water quality results from groundwater monitoring are contained in Appendix A. Of particular interest are the oxidation-reduction potential (ORP) results summarized in Table 1 and Figure 3. ORP is a key indicator in tracking the effectiveness of the iron in treating the contaminants of concern at the site. Generally, when the ZVI develops full effectiveness there are reducing conditions and the ORP is in the -200 mV range.

During baseline sampling only one of the eight monitoring points exhibited negative ORP. In the last sample round (after the ZVI injections) the ORP measured in all eight monitoring points was negative. This suggests that VOCs in the groundwater that contacts the ZVI are being successfully degraded.

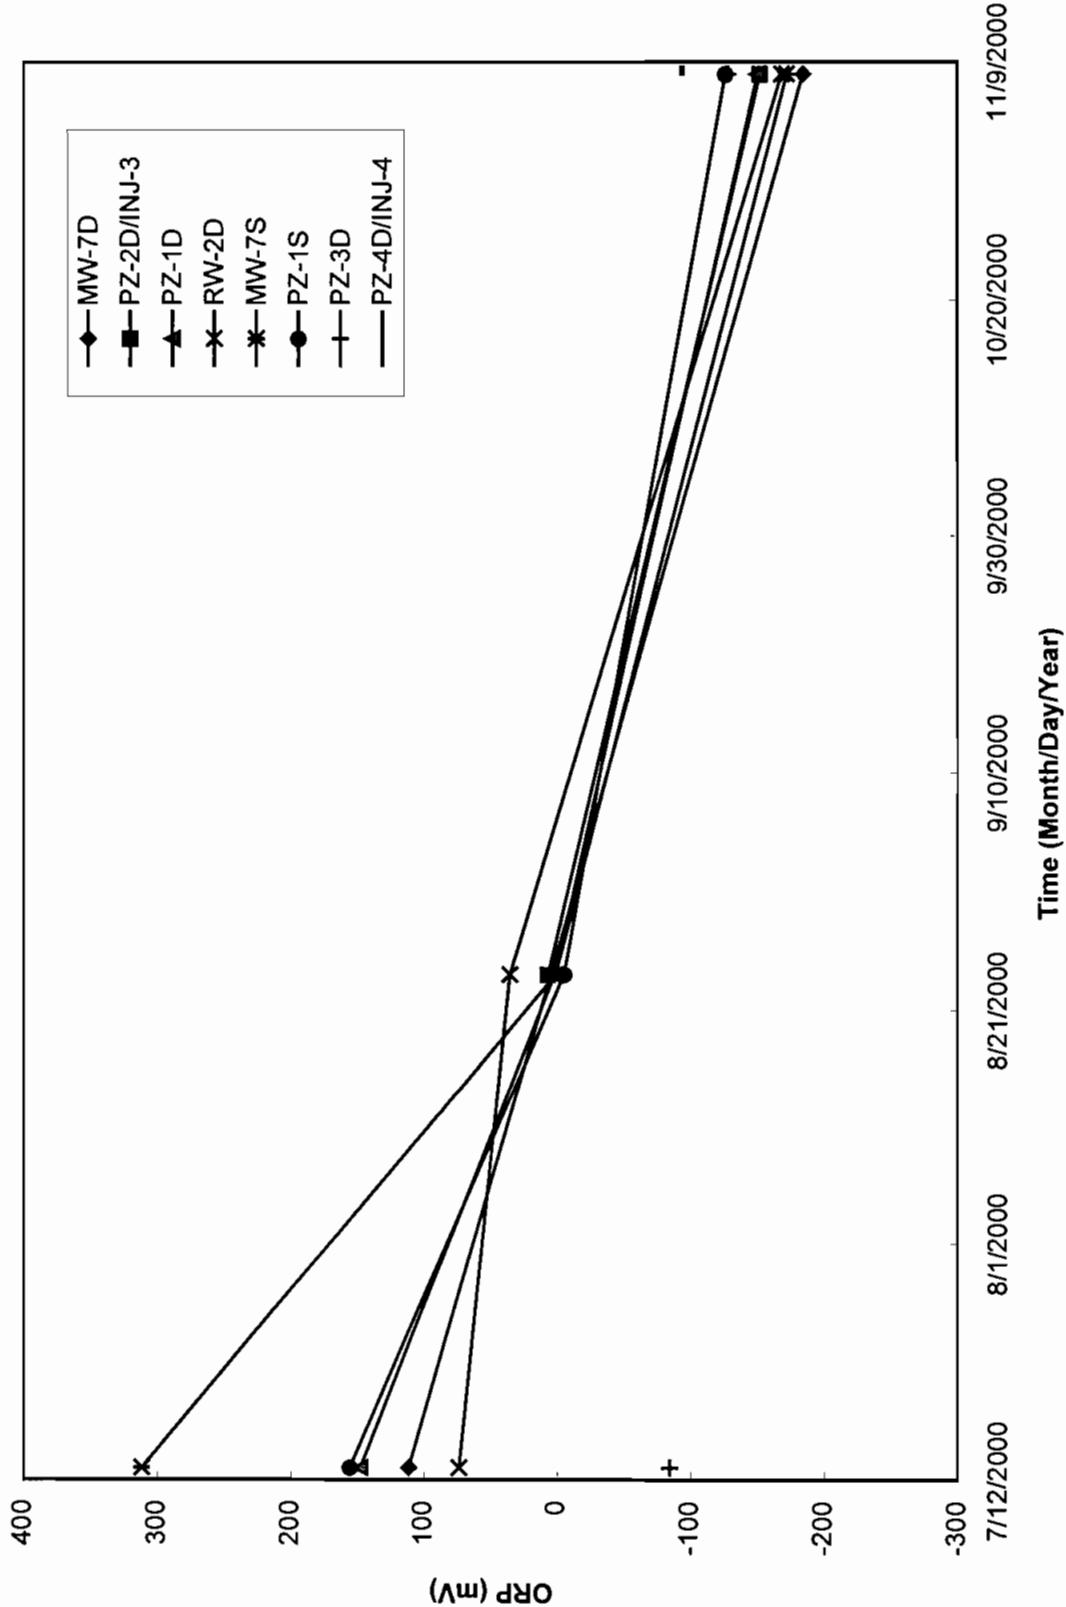

PRW-Deep

The ORP in the deep PRW monitoring points (MW-7D, PZ-2D, PZ-1D, and RW-2D) shows the ZVI has created reducing conditions and is treating VOCs. ORP initially ranged from 73.7 mV to 148 MV and has decreased steadily and currently ranges from about -152 to -184 mV. This decrease in ORP can be a function of both biological activity and ZVI, but based on our experience at other sites, it is typically a result of the ZVI.

**Table 1 - ORP Monitoring Results
Essex/Hope Site, Jamestown NY**

Monitoring Point	ORP (mV)		
	7/13/2000	8/24/2000	11/8/2000
PRW Pilot - Deep			
MW-7D	111.8	4.8	-184
PZ-2D/INJ-3		7.1	-152
PZ-1D	148	1.9	-150
RW-2D	73.7	35.6	-168
PRW Pilot - Shallow			
MW-7S	311.5	1.2	-172
PZ-1S	155.9	-4.9	-126
Source Area Pilot			
PZ-3D	-84.3		-128
PZ-4D/INJ-4			-94

**Figure 3 - ORP Trends
Essex/Hope Site, Jamestown NY**

PRW-Shallow

The ORP in the shallow PRW monitoring points indicates the presence of reducing conditions. ORP has decreased in MW-7S and PZ-1S from 311.5 mV and 155.9 mV to -172 mV and -126 mV respectively. Monitoring well MW-7S should not be directly impacted by the ZVI injections and so would typically show a less negative ORP.

However, ORP decreases at MW-7S are apparent and are likely a result of the iron injections. Because of the close proximity of monitoring well MW-7S to both the PRW and source injections, the negative ORP in this monitoring well may result from an ORP shadow from these adjacent areas. As the pilot test progresses the pilot test data will be evaluated further to determine the possible cause of the negative ORP at MW-7S.

Source Area Injection

The ORP in the source area injections was initially negative in PZ-3D; indicating reducing conditions were present prior to the ZVI injections. This is likely the effect of biological activity occurring prior to the ZVI injections in the source area. After the ZVI injections the ORP decreased somewhat, which suggests that the ZVI created more strongly reducing conditions.

Overall the ORP results shown in Figure 3 suggest that the effect of the ZVI did not begin until after the August 24, 2000 sample round. We suspect that the iron carrier was still impacting the ZVI effectiveness at least until that time. The current reducing conditions suggest that the iron is now successfully degrading the VOCs in the groundwater that contacts the PRW.

Volatile Organic Compound (VOC) Results

VOC results for the first four rounds of sampling are summarized in Figure 4. The base data is contained in Appendix B. The locations of the PRW and source injection pilot tests are also shown on Figure 4.

Source Area Injection

Four source area injections were completed for the source control pilot test. Monitoring points for the source injections consist of PZ-3D and PZ-4D. Monitoring point PZ-3D is located in the center of the four ZVI injections. PZ-4D was completed within ZVI injection point INJ-4. Both monitoring points are screened over the entire (20-foot) saturated thickness of the deep zone.

DRAWING TITLE
Summary of PRW Pilot Test Results (11/8/00)
Essex/Hope Site, Jamestown NY
CAD DRAWING FILE: DOW/JAMESTOWN/B3
CONTRACT NO: 804041.81
DRAWING NO: B-3

Plots showing the concentration of TCE over time in PZ-3D and PZ-4D are shown in Figure 5 and Figure 6 respectively. Relatively high concentrations of TCE were detected in both monitoring points at the beginning of the pilot test. Prior to the pilot test, groundwater samples from PZ-3D (GP-1D) had TCE concentrations of 135.5 mg/L. As indicated above, PZ-4D is installed within an iron injection point and so could not be sampled prior to the ZVI injections. Just after the ZVI source injections, concentrations of TCE in PZ-4D were detected at 367 mg/L. TCE concentrations have decreased to 30 mg/L in PZ-3D, and to 5.3 mg/L in PZ-4D, in a period of about three months.

The reductive dechlorination of TCE produces degradation byproducts. Based on the analytical results, minimal degradation byproducts were produced by the ZVI reaction with TCE. The primary byproduct detected in groundwater samples is cis-dichloroethylene (cis-DCE), the corresponding production of trans-DCE is negligible. Consistent with the bench scale testing, vinyl chloride (VC) was produced, but at levels we anticipate will be reduced to ethene given the long contact times in the deep zone.

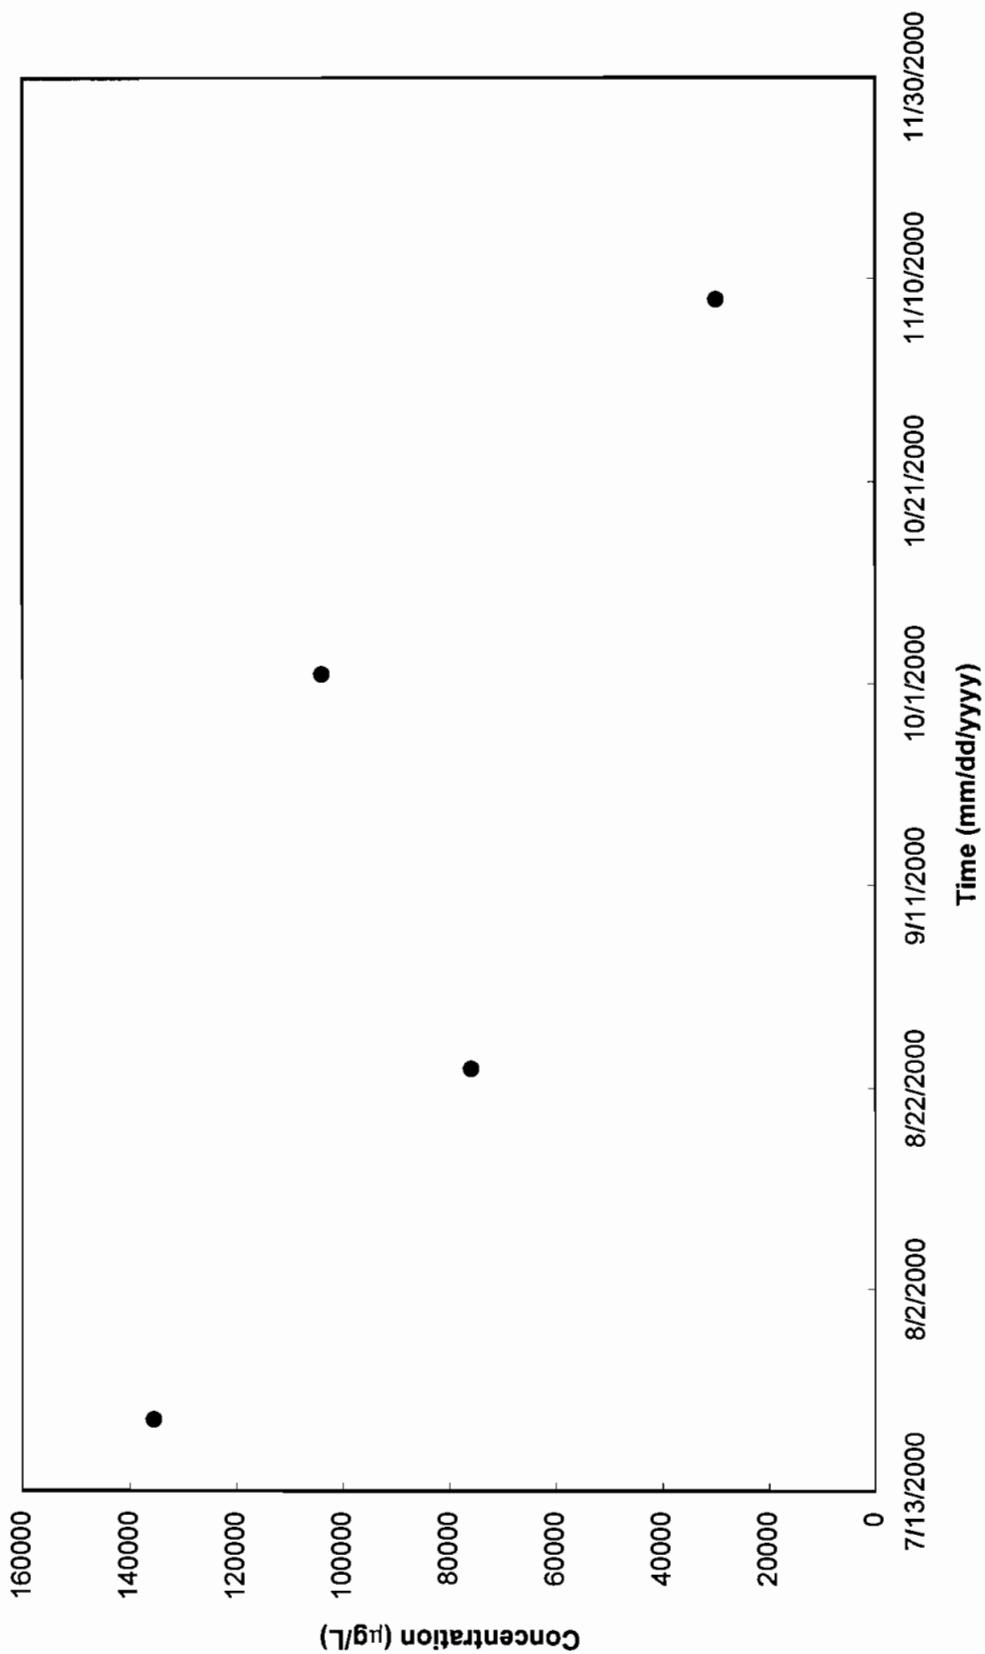

For predictive purposes a curve was fitted to the PZ-3D TCE data to project how long it might take to achieve low mg/L levels (Figure 7). Dropping the October 2, 2000 data point (which is suspect due to difficulties during analysis), we achieved a good correlation (0.994) with the data. Based on the curve, we anticipate we may achieve low mg/L concentrations in PZ-3D, by April 2001.

PRW-Deep

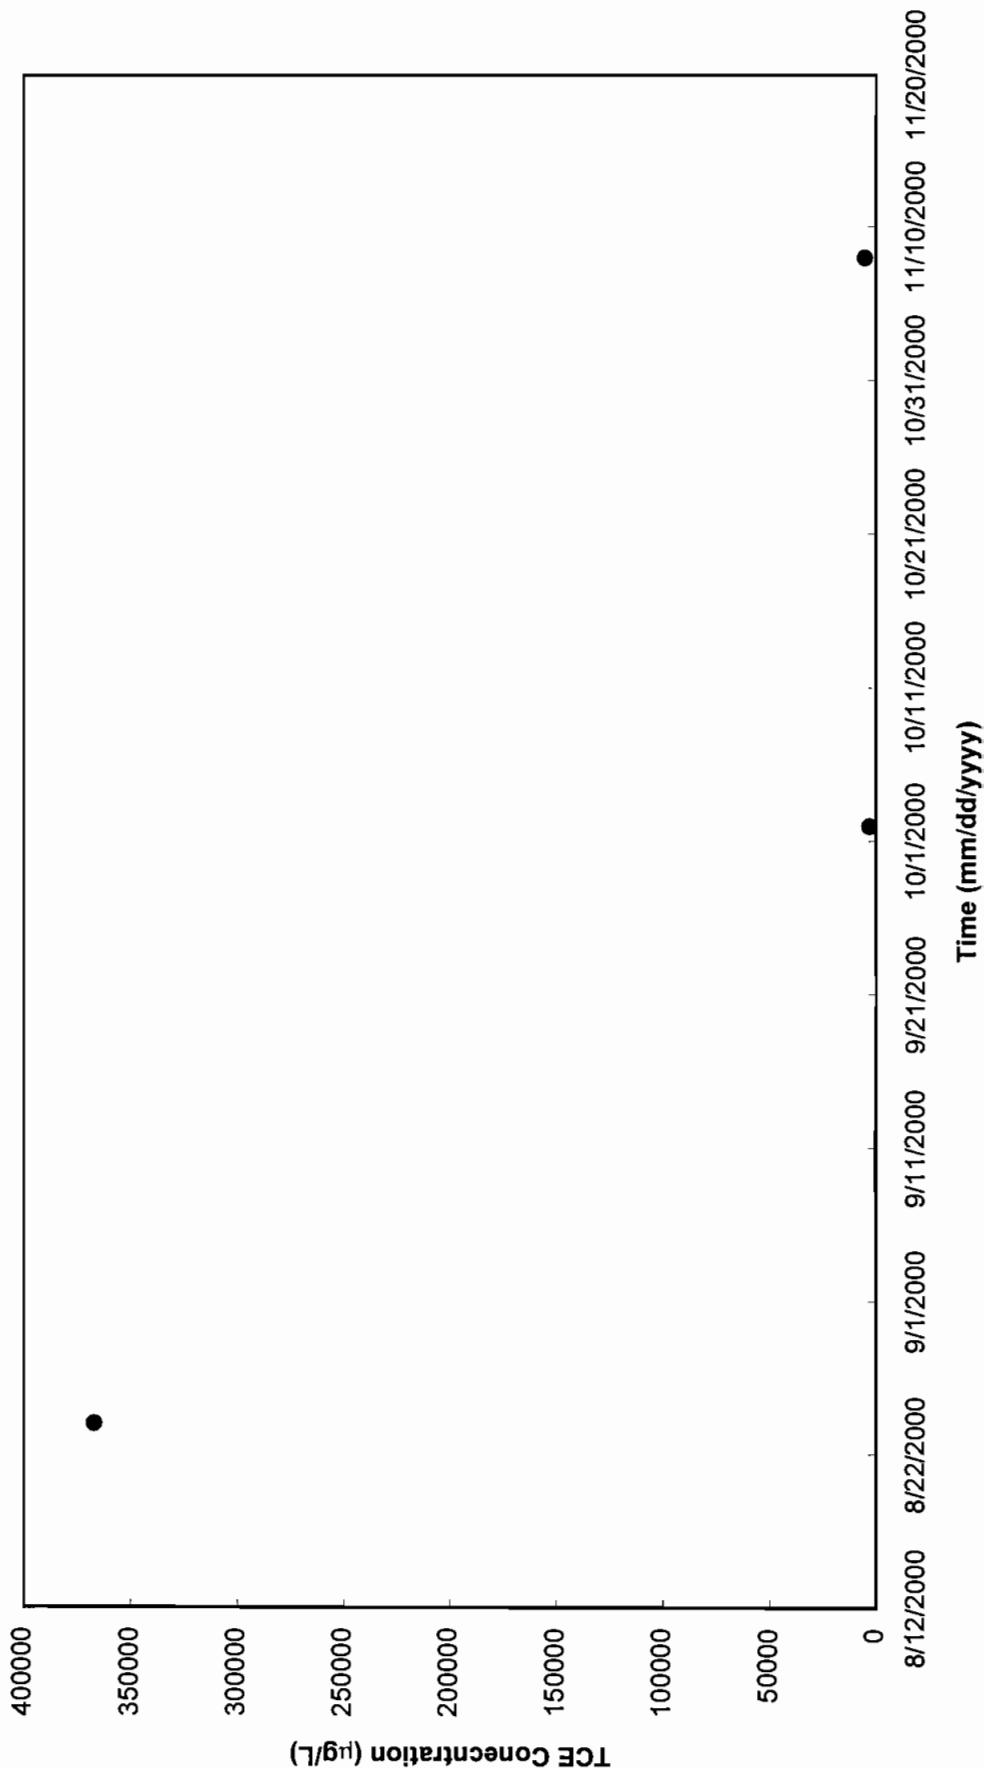

Monitoring points for the deep PRW include PZ-2D, PZ-1D, and RW-2D. Monitoring point PZ-2D was completed in injection INJ-3. PZ-1D is located down gradient of the PRW, between PZ-2D and RW-2D. Monitoring point RW-2D is a groundwater recovery well located in the center of the PRW (Figure 4).

Plots of TCE concentration versus time for the deep PRW are shown in Figure 8, Figure 9 and Figure 10. The levels of TCE in PZ-1D and RW-2D start lower, increase somewhat, and then show a generally decreasing trend. Our experience is that this is a result of the displacement of groundwater by the iron carrier amendment used in the injections, and the gradual dissipation of the amendment. During the injections a significant volume of fluid is pumped into the ground, this tends to flush and displace contaminated water in the vicinity of the PRW. The result is that initially we may see lower (or different) concentrations in the groundwater after the injections, followed typically by some rebound of the VOC levels as groundwater later displaces the injection amendment, and re-equilibrates with surrounding soils. The degree of rebound and when it occurs is site specific. As the iron carrier amendment dissipates further, we see ZVI effectiveness continue to improve, and steady declines in contaminant levels.

**Figure 9 - TCE versus Time
PRW Monitoring Point PZ-1D
Essex/Hope Site, Jamestown NY**

**Figure 10 - TCE versus Time
PRW Monitoring Point RW-2D
Essex/Hope Site, Jamestown NY**

The generally decreasing trend in TCE levels in early October is consistent with the ORP data which went negative (indicating reducing conditions) sometime between August 24, 2000 and November 8, 2000. The combined VOC and ORP data are consistent with a rebound in the VOC levels that occurred as the amendment dissipated, where VOC levels peak as the iron begins to "work" (as evidenced by decreasing ORP), followed by declines in TCE levels as the iron works more effectively.

Even though the ZVI may be effectively treating VOCs, the VOC results will typically show a delayed response. That is because the residual VOCs in the soil and groundwater down gradient of the PRW must be flushed before the full effect of the ZVI is seen. Given the high initial concentrations of TCE (59.4 mg/L) in the deep zone at PZ-1D, just down gradient of the PRW, flushing will likely take longer than usual. By extension, decreases in the levels of VOCs in RW-2D may also be delayed.

PRW-Shallow

The shallow PRW shows no effect on TCE concentrations to date. Due to the relatively low groundwater velocities in the shallow aquifer (about 0.3 feet/day), and the need to flush residual levels of contaminants, it may take more time for the pilot test to develop. As discussed above, the pilot test data for the shallow zone will be evaluated further to determine why the PRW has not reduced TCE concentrations.

Groundwater Hydraulic Results

The groundwater elevations measured at the pilot test monitoring points are shown in Table 2.

PRW-Deep

The deep zone potentiometric surface for November 8, 2000 is shown in Figure 11. The gradient indicates groundwater flow through the PRW to RW-2D.

The natural groundwater velocity in the deep zone is the velocity that was present under natural gradients, prior to the existing pump and treat system. The natural groundwater velocity (about 0.03 ft/day) is lower than the pilot test velocity (about 1.8 ft/day). The pilot test is being conducted under pumping conditions, which create high gradients in the potentiometric surface in the vicinity of the pumping well. The pumping at RW-2D (and high gradient) allows us to conduct the PRW pilot test under high velocity conditions. This has two benefits, first it allows us to conduct the pilot test in a reasonable period of time, and second, it tests the PRW under a worst case (high velocity) scenario.

PRW-Shallow

The pilot test in the shallow aquifer is also being conducted under induced gradients. Figure 12 shows the water surface in the shallow zone on November 8, 2000. Groundwater flow is to the northwest and through the shallow PRW. Based on the hydraulic conductivity developed previously for MW-7 S we estimate groundwater velocities in the shallow aquifer at the PRW to be about 0.6 feet/day. The relatively long hydraulic retention time (HRT) coupled with the historically low levels of TCE in the shallow zone suggest that high levels of treatment can be achieved, and that the shallow PRW will be successful.

Source Area Injection

Groundwater elevations for the source injection area are also shown in Figure 11. Based on the potentiometric surface, groundwater flows through the source area roughly to northwest, with an induced gradient to RW-2D. Based on an average hydraulic conductivity for the deep zone developed and the November 8, 2000 hydraulic gradient we estimate the groundwater velocity in the vicinity of the source injections is about 0.15 feet/day. This suggests the VOCs in the groundwater will have ample contact time with the iron from the source injections, and will achieve high levels of treatment.

CONCLUSIONS

The ORP data show the ZVI has created reducing conditions, which indicate that VOCs that come in contact with the ZVI are degraded.

The VOC data show the PRW and source injections are successfully degrading VOCs. As residual VOCs undergo more flushing and the ZVI continues to create reducing conditions we anticipate continuing decreases in the levels of VOCs.

The initial rebound in VOC levels and the subsequent decreases, in conjunction with decreasing trends in ORP suggests the iron carrier amendment initially impacted the ZVI effectiveness.

Consistent with the bench scale testing, degradation byproducts were produced during the pilot test. Given the long contact times between the groundwater and ZVI, we anticipate the degradation byproducts further degrade to ethene over time.

Groundwater elevations indicate groundwater flow through the PRWs and source injection area. Groundwater velocities suggest the presence of adequate contact times for VOC treatment.

RECOMMENDATIONS

The following recommendations are proposed:

1. Continue to monitor the performance of the PRW and source injection pilot tests.
2. Extend the duration of the pilot tests until April to demonstrate the ZVI can treat VOCs at the site to low levels. At that time re-evaluate the analytical results and make any additional recommendations based on the data evaluation.

If you have any questions about the pilot test results, please contact Ben Baker at (517) 636-0787 or me at (414) 831-4115.

Sincerely,

James Imbrie, PE
Senior Engineer
