Job Number AOH704537  
Customer Purchase Order Number: 1193

Dear Mr. Crawford:

Enclosed are the results obtained from the asbestos identification for the above referenced sample. Analysis of the sample was made using the polarizing light microscope (PLM) and dispersion staining objective in accordance with guidelines set forth in the EPA Method for the Determination of Asbestos in Bulk Building Materials, U.S. EPA/600/R-93/116 (7/93 Edition).

RJ Lee Group, Inc. is accredited by the National Voluntary Laboratory Accreditation Program (NVLAP) for selected test methods for airborne asbestos fiber analysis (TEM) and asbestos fiber analysis (PLM). RJ Lee Group's Monroeville laboratory is accredited by the American Industrial Hygiene Association for asbestos, silica and metals.

These results are submitted pursuant to RJ Lee Group's current terms and conditions of sale, including the company's standard warranty and limitation of liability provisions and no responsibility or liability is assumed for the manner in which the results are used or interpreted. Unless notified in writing to return the samples covered by this report, RJ Lee Group will store the samples for a period of ninety (90) days before discarding. A shipping and handling fee will be assessed for the return of any samples.

| Sum of ranks: | R1 = 880.5 | R2 = 925.0 | R3 = 472.5 |
| Average rank: | Ra1 = 25.9 | Ra2 = 57.8 | Ra3 = 27.8 |

Kruskal-Wallis statistic: H = 31.5

**Adjustment for Ties:**

- T1 = 2730 for the 14 observations of BQL
- T2 = 6 for the 2 observations of 2.50
- T3 = 6 for the 2 observations of 1.23

Corrected Kruskal-Wallis statistic: H' = 31.8

Compare H' to the tabulated chi-squared value of 2 degrees of freedom at 5% significance level (Table 1, Appendix B of EPA 1989).

H' = 31.8 > 5.991 There is evidence of significant differences between the well groups.

**Computing the critical difference for comparing compliance wells to the background wells:**

| Differences | Critical Values |
|-------------|-----------------|
| D2 = 31.9   | C2 = 11.58      |
| D3 = 1.9    | C3 = 11.58      |

D2 > C2 There is evidence of contamination at well WT-3

D3 < C3 There is not evidence of contamination at well WT-4

Dunkirk, New York Facility

Compute the Bonferroni statistic to determine whether the significant F-value is due to differences between background and compliance wells

Average fluoride (natural log) concentration of background wells WT-1A and WT-1B: -0.079

Differences between mean compliance well and mean background well fluoride concentrations:

| <u>Well</u> | <u>Differences</u> |
|-------------|--------------------|
| WT-3        | 1.443              |
| WT-4        | 0.7964             |

Compute the standard error for each difference:

| <u>Well</u> | <u>Standard Error</u> |
|-------------|-----------------------|
| WT-3        | 0.1545                |
| WT-4        | 0.1545                |

Obtain the t-statistic from Bonferroni's t-table. Critical  $t = 1.96$  with  $m=2$  and for a 5% significance level and 63 degrees of freedom (see Table 3, Appendix B of EPA 1989).

Compute the  $m$  quantities  $D_i = \text{Standard Error} \times t$  for each compliance well.

| <u>Well</u> | <u><math>D_i</math></u> |
|-------------|-------------------------|
| WT-3        | 0.3028                  |
| WT-4        | 0.3028                  |

Both compliance wells exceed the critical value,  $D_i$ , and thus there is evidence of fluoride contamination at these wells.
