THE LONG-TERM MONITORING PROGRAM

The Long Term Monitoring Program examines hydrological and chemical data from the Love Canal area in order to evaluate the overall effectiveness of the containment system. In 1993, one round of samples was collected from 36 long term monitoring wells that surround the site. Included in this sampling program were selected wells on the west side of the Dewatering Containment Facility (DCF). Approximately bi-monthly groundwater elevations are taken in six groups of piezometers located around the site.

The basic conclusion from the 1993 data is that they are essentially similar to 1989's, 1990's 1991's and 1992's, and that the barrier drain is functioning as designed.

This conclusion is supported by both the hydrological and chemical evidence.

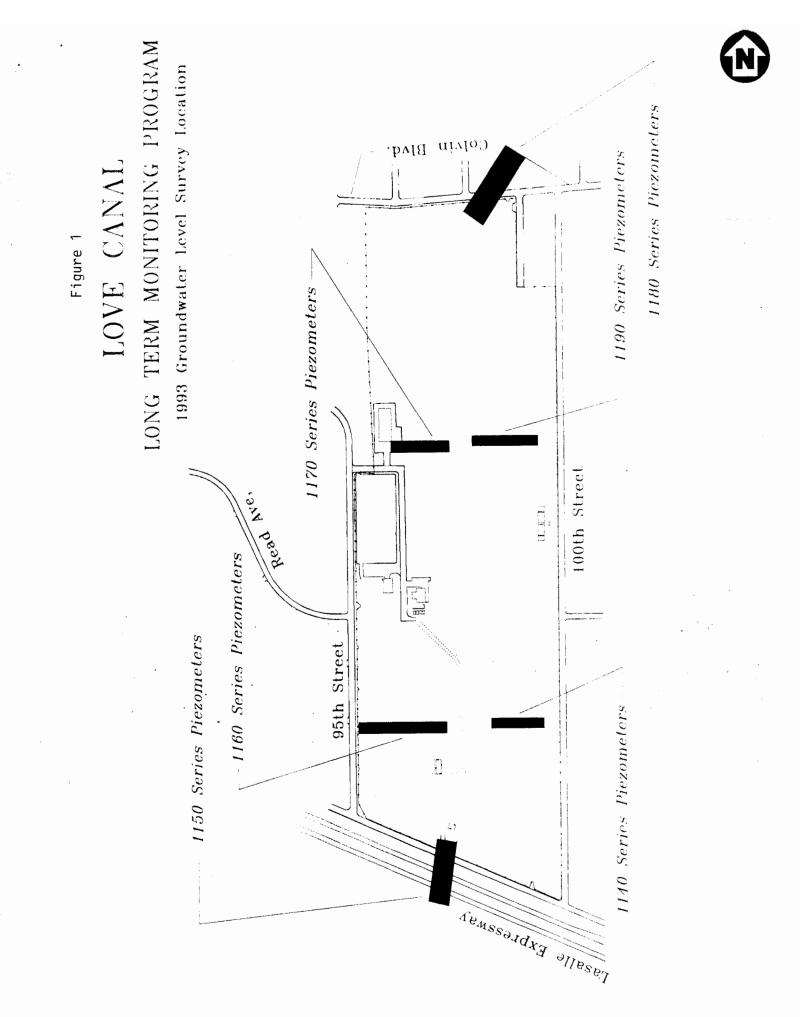

Results of Groundwater Monitoring Hydrology

Readings were taken on six dates during the year from the six series of piezometers that were strategically placed to monitor groundwater elevations along varying cross-sections of the Canal. Figure 1 identifies the location of the piezometers. Figure 2 is a flow diagram representing groundwater conditions in April 1993 at one of the series of piezometers at right angles to the barrier drain. Groundwater flow is toward the leachate collection system. The vertical scale on the cross-section is exaggerated 5 times over the horizontal scale, to aid in interpretation.

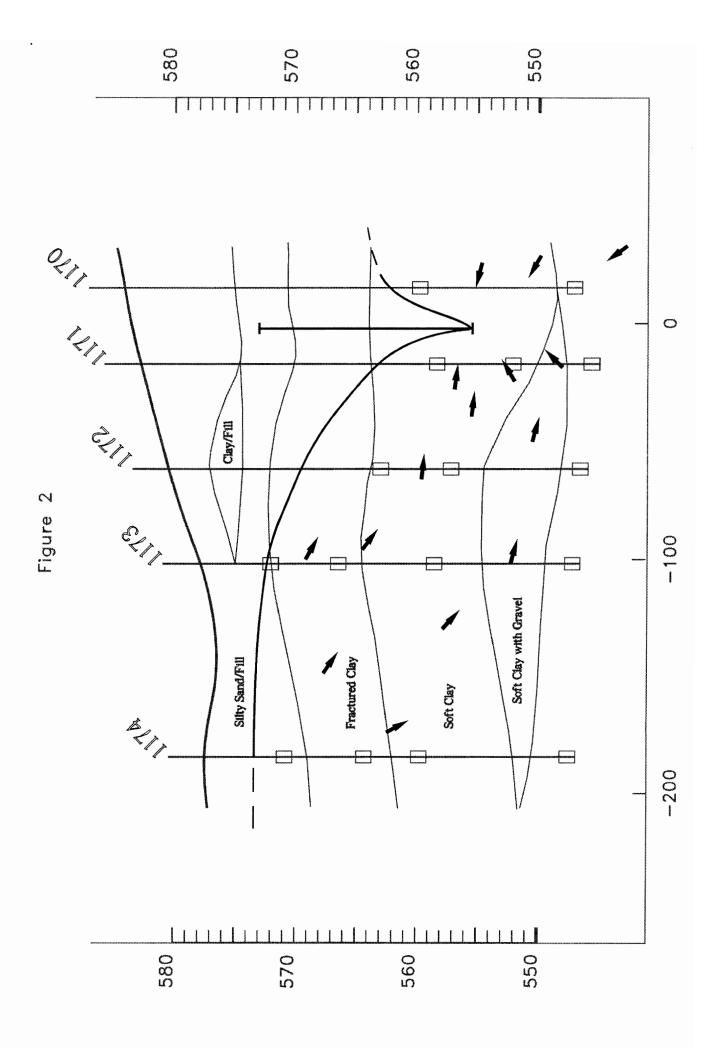

No abnormal groundwater conditions were noted during the hydrologic sampling events of 1993 compared to 1992. The barrier drain is capturing all leachate migrating horizontally outward from the Canal, as well as pulling groundwater, which is outside the barrier drain, back toward the drain. Vertical groundwater migration is limited by layers of extremely low permeability clay and glacial till, which underlays all of the site.

Results of Groundwater Monitoring Chemistry

In addition to the piezometers, there is a system of overburden and bedrock wells designed primarily for monitoring the chemical quality of groundwater at the Love Canal site. Sampling was conducted in the system of overburden and bedrock wells designed for monitoring the chemical quality of groundwater ("LTM wells"). The LTM wells are located in a pattern designed to optimize their usefulness in detecting any failure that might occur in the effectiveness of the barrier drain system. In 1993 we began a plan of sampling half of the overburden wells around the perimeter of the site. Half of the LTM wells that are screened in the overburden were

i. Kao ka .

sampled in 1993 and the other half will be sampled in 1994. In 1993 two piezometers were sampled in addition to LTM wells. During 1993, samples were collected from 37 wells and 18 blanks were submitted for quality control purposes. Figure 3 indicates the location of the wells.

In 1993 the New York State Department of Health (DOH) provided analytical services for the long term monitoring activities at the Love Canal site. Appendix A (attached) is a listing of analytical results. As in previous years, the analytical results were characterized by a predominance of non-detect ("ND") values. When the laboratory has any indication that a compound is definitely present in a sample, that fact is reported. Each time a laboratory analysis is performed there is a level for each compound called the "detection limit." If a compound is present below this level the precise quantity of the compound cannot be accurately determined. In such a case the compound is said to be "present at or below the detection limit" and the result is reported with a "J" qualifier. This reporting protocol was followed by the New York State Department of Health for the 1993 analyses.

As in 1992, the 1993 results included a large number of tentatively identified compounds (TICs). Prior to 1992 only a relative few TICs were reported. In 1992, compounds tentatively identified as methyl benzene (toluene) were reported in samples collected from several wells located along the northeastern perimeter of the site. Toluene TICs were not seen in 1993.

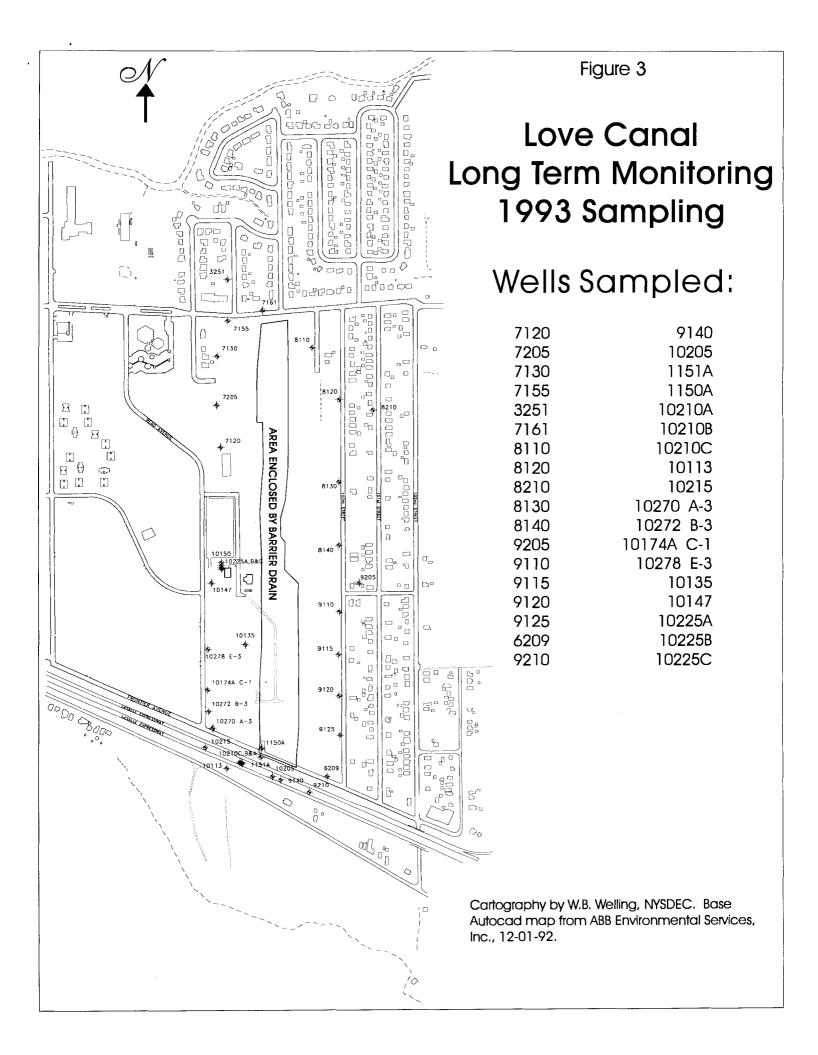

As in previous years, most of the samples showed relatively low levels of phthalates, particularly bis-(2-Ethylhexyl)Phthalate. It was also present in many of the associated blanks. Phthalates are common constituents of plastics used in sampling and laboratory tubing.

Each instance where contaminants were detected at or above the laboratory detection limit is discussed below. The relatively low number of contaminants detected and the fact that the levels detected are close to the detection limits does not indicate a need for action at this time. However, future results will continue to be tracked with special attention to any evidence of a change in groundwater quality.

1993 Results:

- 36 wells were sampled along with 18 blanks (12 field blanks, 5 holding blanks and one field blank).
- Sulfur was detected in 13 wells.
- Bis(2-ethylhexyl)phthtalate was found in 16 wells at a concentration above the detection limit and significantly greater than blank contamination (10X).

The only wells showing significant contamination were 10135 and 1150A. These two wells were expected to be contaminated since they are within the known contaminated zone. These wells were sampled as comparison wells. Groundwater contamination is not migrating from Love Canal based upon the 1993 data.

Well-by-Well Summaries

.

The next section of this document describes the wells exhibiting organic chemical contamination. Chemical compounds detected in 1993 are presented immediately after the well number to which they pertain. Comments from the 1992 annual report pertaining to these wells are also addressed.

Well #10135 (DOH analysis)

1,4-dichlorobenzene	94
1,2-dichlorobenzene	35
2,4-dichlorophenol	420
1,2,4-trichlorobenzene	74
2,4,5-trichlorophenol	70
alpha-BHC	42
pentachlorophenol	52
beta & gamma-BHC (sum of isomers)	19.5
delta-BHC	9.8P
aldrin	0.24P
endosulfan sulfate	0.43P
methylene chloride	41
1,1-dichloroethene	15
1,2-dichloroethene (total)	840
chloroform	100
1,1,2,2-tetrachloroethane	12B
trichloroethyene	24
chlorobenzene	1700
phenol	98
bis(2-chloroethyl)ether	23
2-methylphenol	51
4-methylphenol	60
bis(2-ethylhexyl)phthalate	50
camphor	130
acetone	270
2-butanone	36
benzene	5200
toluene	17000E
ethylbenzene	13
total xylenes	47
nonanal (RT=19.32) [TIC]	200JN
furan, tetrahydro-2-methyl- (RT+5.01) [TIC]	86JN
dodecanal [TIC]	220JN
phenol, 2,4-bis(1,1-dimethyl [TIC]	53JN

As noted in previous reports, Well #10135 is the only well in the Long Term Monitoring network intentionally installed into an area of known contamination. It monitors groundwater close to the leachate

collection system. This well has consistently shown elevated levels of chemical compounds such as chlorobenzenes, chlorophenols, benzoic acid, and hexachlorocyclohexane (BHC). Further discussion of well 10135 comparing chemical data from 1993 and previous samplings is included in the discussion for well 1150A, below. These listed compounds are typical of Love Canal chemistry and are considered to represent contamination which escaped into the environment prior to construction of the barrier drain system. The results from well 10135 are used as a baseline for comparison with findings from the other monitoring wells. If the Canal were to leak, similar compounds at similar levels would begin to be detected in other wells.

Independent hydraulic evidence indicates that Well #10135 is within the hydraulic influence of the barrier drain system, thus groundwater in the vicinity is likely to be flowing back toward the leachate collection system. The well is approximately 85 feet outside the barrier drain, which is closer to the drain than other long term monitoring wells. (Refer to Figure 3 for its location).

Well #1150A (not a regularly sampled well) (DOH analysis)

.

2-chlorophenol	47
1,3-dichlorobenzene	170
1,4-dichlorobenzene	1600E
1,2-dichlorobenzene	670
1,2,4-trichlorobenzene	3200E
4-chloro-3-methylphenol	34
2-chloronaphthalene	1100E
hexacholorbenzene	61
methylene chloride	70
chloroform	14
chlorobenzene	6400
2,3-dichlorotoluene [TIC]	1100JXN
benzene, 1-chloro-2-methyl- [TIC]	4300JXN
benzene, 1-chloro-4-methyl- [TIC]	4800JXN
2-methylphenol	33
4-methylphenol	57
2,4-dimethylphenol	23
naphthalene	86
2,4-dinitrotoluene	260
bis(2-ethylhexyl)phthtalate	2300E
di-n-octyl phthalate	12
acetone	270
2-butanone	46
benzene	5000
toluene	4900
total xylenes	34
unknown t-butyl compound (RT=13.83) [TIC]	2400JX
furan, tetrahydro-2-methyl- (RT-5.01) [TIC]	1600JXN

Piezometer 1050A was sampled in 1993 to compare analysis results with well 10135. 1050A and 10135 are both known to be contaminated. For comparison, all values reported in 1993 for 1050A are listed in boldface

along side well 10135. In 1993, 26 of 38 Love Canal indicator chemicals were present in well 10135 and 19 of 36 of the same chemical compounds were present in well 1150A. Chemical contamination in well 1150A is similar to that of well 10135 as the following chart indicates:

•

"NA" indicates not analyzed.

.

"ND" indicates not detected.

"NF" is used for TICs only and indicates not found.

"J" indicates that the compound was detected at a level below the detection limit for the analysis. The detection limit is the value below which confidence in the result cannot be guaranteed.

"P" indicates that there is a greater than 25% difference for detected concentrations between the two GC columns in the pesticide/Aroclor target analyte. The lower of the two values is reported.

"E" indicates that the concentration for this compound exceeded the calibration range of the GC/MS instrument for that specific analysis.

"B" indicates that the compound was also found to be present in the laboratory blank for the analytical run. Data before 1993 has not been validated to determine whether such contamination is laboratory related. In 1993 "B" flagged results which are attributable to lab contaminatin are not presented in the well-by-well listings.

"C" indicates that the value was confirmed either by mass spectrographic analysis or re-examination of the analytical data.

"X" indicates that a combination of flags is required to properly define the results and "X" represents more that one qualifier flag.

"N" indicates presumptive evidence of a compound. The "N" flag is only used for tentatively identified compounds where the identification is based on a mass spectral library search. It is applied to all TIC results.

bis(2-ethylhexyl)phthtalate	11
nonal (RT=19.32) [TIC]	5JN

In 1992 Low levels of 1,1,1-trichloroethane were detected in this well. In addition, low levels of phenol, 4-nitrophenol, n-nitrosodiphenylamine, benzene, 4-methyl-2-pentanone, toluene were also detected. Acetone was also detected in the sample collected from this well at 31 ppb. However, in 1993, of these previous compounds, only acetone and benzene were detected at very low levels (below detection limits).

Well # 10210C (well along the LaSalle Expressway) (DOH analysis)

bis(2-ethylhexyl)phthtalate	38
acetic acid [TIC]	11

In 1992 very low levels of phenol, 4-methylphenol, isophorone, 2,4-dinitrophenol, and benzo(k)fluoranthene were detected in the sample collected from this well. These were not present in 1993.

Well # 10215 (well along the LaSalle Expressway) (DOH analysis)

hexadecanoic acid, 2-methylpropyl ester [TIC]	7
octadecanoic acid, 2-methylpropyl ester [TIC]	6
nonal (RT=19.32) [TIC]	5JN

In 1992 pentachlorophenol was detected at 7 ppb in well which is below the 10 ppb detection limit. Very low levels of halogenated compounds such as 2-chlorophenol, 2,4-dichlorophenol, monochlorocresol, 2,4,5trichlorophenol, and 2,4,6-trichlorophenol were also detected the sample collected from this well. None of these compounds were detected in 1993.

Responses to issues raised in 1993 over the 1992 data

- Analysis was again performed by the DOH lab to continue to give continuity to the annual sets of analytical results.
- Well 1050A, a known contaminated well inside the barrier drain, was sampled in 1993 to augment the data collected from well 10135. Compounds present are similar to those present in well 10135.
- In sampling the wells along the LaSalle Expressway, care was taken to sample them in dry weather. We postulate that road spray from vehicular traffic had introduced PAH contamination during sampling in 1992.
- The DEC Mobile Lab analyzed duplicate sets of samples from wells 10210C, 10225C, 6209, 7161 and 10272. The cross check occasionally raises questions over tentatively identified compounds.
