NOVEMBER 2019

CERTIFICATIONS

I, Ariel Czemerinski, P.E., am currently a registered professional engineer licensed by the State of New York, I had primary direct responsibility for implementation of the remedial program activities, and I certify that the Remedial Action Work Plan was implemented and that all construction activities were completed in substantial conformance with the Department-approved Remedial Action Work Plan.

I certify that the data submitted to the Department with this Final Engineering Report demonstrates that the remediation requirements set forth in the Remedial Action Work Plan and in all applicable statutes and regulations have been or will be achieved in accordance with the time frames, if any, established for the remedy.

I certify that all use restrictions, Institutional Controls, Engineering Controls, and/or any operation and maintenance requirements applicable to the Site are contained in an environmental easement created and recorded pursuant ECL 71-3605 and that all affected local governments, as defined in ECL 71-3603, have been notified that such easement has been recorded.

I certify that a Site Management Plan has been submitted for the continual and proper operation, maintenance, and monitoring of all Engineering Controls employed at the Site, including the proper maintenance of all remaining monitoring wells, and that such plan has been approved by the Department.

I certify that all documents generated in support of this report have been submitted in accordance with the DER's electronic submission protocols and have been accepted by the Department.

I certify that all data generated in support of this report have been submitted in accordance with the Department's electronic data deliverable and have been accepted by the Department.

I certify that all information and statements in this certification form are true. I understand that a false statement made herein is punishable as a Class “A” misdemeanor, pursuant to Section 210.45 of the Penal Law. I, Ariel Czemerinski, P.E., of AMC Engineering PLLC, am certifying as Owner’s Designated Site Representative for the Site.

FINAL ENGINEERING REPORT

1.0 BACKGROUND AND SITE DESCRIPTION

1.1 SITE BACKGROUND

M & H Realty Developers a/k/a M & H Realty LLC entered into a Brownfield Cleanup Agreement (BCA) with the New York State Department of Environmental Conservation (NYSDEC) in August 2014, to investigate and remediate a 4.88-acre property located in Brooklyn, New York. The property was remediated to restricted residential use, and will be used for restricted residential and commercial use.

The environmental easement for the Site was executed by the Department on XXXX, 2019, and filed with the Kings County Office of the City Register on XXXX, 2019. The City Register File Number (CRFN) for this filing is 2019110700464001. A copy of the easement and proof of recording is provided in Appendix B.

1.2 SITE LOCATION

The Site is located in the County of Kings, New York and is identified as Block 2570 and Lot 1 on the New York City Tax Map. The Site is situated on an approximately 4.88-acre area bounded by Oak Street to the north, Quay Street t o the south, West Street to the east, and the East River to the west (see Figure 1). Lot 1 consists of 480 feet of street frontage on West Street, 400 feet of frontage on the East River and is approximately 750 feet deep for a total area of 213,000 square feet. The boundaries of the Site are fully described in Appendix B: Survey Map, Metes and Bounds.

The elevation of the Site is from 9 feet to 1 foot above the National Geodetic Vertical Datum (NGVD). The area topography gradually slopes to the east. Groundwater at the Site is present under water table conditions at a depth of approximately 5-15 feet below grade. Based on Site specific references, the predominant groundwater flow direction is expected to be west toward the East River, though flow will likely reverse up to 400 feet inland during periods of high tide.

The area surrounding the property is highly urbanized and predominantly consists of commercial, industrial and residential buildings with mixed-use buildings (residential w/ first floor retail) along main corridors / thoroughfares.

An electronic copy of this FER with all supporting documentation is included as Appendix A.

1.3 FORMER SITE USE

Prior to remedial activities, the Site consisted of three buildings and a large open lot used for vehicle storage. The buildings consisted of a 90 ft x 530 ft one-story raised platform, two-sided loading dock and storage building (raised terminal platform building), a 50 ft x 70 ft two-story building formerly used for truck maintenance which included a cellar utilized for the boiler and electrical rooms, and a 25 ft x 50 ft building formerly used for truck repair/maintenance.

Previous owners and operators of the property are shown in the tables below. Information regarding ownership of the property was obtained from online property records maintained by the NYC Department of Finance Office of the City Register under its Automated City Register Information System (ACRIS). Information regarding past operators was obtained from lease agreements, Sanborn Fire Insurance Maps, and from a City Directory Search and internet search of the property address.

Previous Owners

Prior to 1/2/1974	All states Terminal Corp.	Deed	11 West Street, Brooklyn, NY 11222
From 1/2/1974 to 12/31/1974	Fifth Terminal Corp.	Deed	725 Church Avenue, Brooklyn, NY 11218
From 12/31/1974 to 1/14/1977	Arbern Realty Co.	Deed	600 Old Country Road, Garden City, NY 11530
From 1/14/1977 to 4/16/2001	NYC Industrial Development Agency	Deed	225 Broadway, New York, NY 10007
From 4/16/2001 4/16/2001	P. Chimento Company, Inc.	Deed	11 West Street, Brooklyn, NY 11222
From 4/16/2001 to 5/14/2002	Consolidated Freightways Corporation of Delaware	Deed	16400 SE CF Way, Vancouver, WA 98683
From 5/14/2002 to 12/23/2002	CFCD 2002 LLC	Deed	16400 SE CF Way, Vancouver, WA 98683
From 12/23/2002 to Present	M&H Realty LLC	Deed	420 9th Avenue, New York, NY 10001

Note: M&H Realty LLC is in no way affiliated with any of the prior owners of the property.

Previous Operators

Dates	Name	Comments	Contact Info
Prior to 1961	Samuel Sneden & Company	Maritime Historic Accounts	Unknown 11 West Street, Brooklyn, NY 11211
From 1861 to sometime between 1916 and 1922	Continental Iron Works	Sanborn Maps Maritime Historic Accounts	Unknown 11 West Street, Brooklyn, NY 11211
From sometime between 1942 and 1951	Lumber Yard	Sanborn Maps	Unknown 11 West Street, Brooklyn, NY 11211
From sometime between 1942 and 1965	Machine Shop and Welding operation	Sanborn Maps	Unknown 11 West Street, Brooklyn, NY 11211
From sometime between 1951 and 1978	Associated Trucking Co.	Sanborn Maps	44 Yale Street Inwood, New York, 11096
1978 to 2002	Consolidated Freightways	Sanborns	16400 SE CF Way, Vancouver, WA 98683
From 2009 to Present	South Portion: Tri-State Lumber & Building Supply North Portion: One Stop L.I.C.	Owners Knowledge	South Portion: 11 West Street, Brooklyn, NY 11211 North Portion: 37-30 Review Avenue, Long Island City, NY

Note: M&H Realty LLC not affiliated with any of the prior operators of the property.

The environmental history of the Site was previously investigated through the review of Federal and State Environmental databases, Environmental Sanborn Fire Insurance maps, NYC Department of Building records and the NYC Department of Finance databases as part of the Phase I Environmental Site Assessment completed in March 2014 by EBC. Additional historic information was obtained through web searches related to the history of the Greenpoint water front.

A history dating back to 1855 was established. According to historic accounts the property was originally occupied in the 1850's by Samuel Sneden & Company, a builder of wooden steamboats and riverboats. In 1859 the company added an iron foundry and related equipment and began to build iron steamships and ferry boats. In 1861the company's name was changed to Continental Iron Works and began to build additional iron products such as iron water pipes and

boilers. In 1862 the company was contracted to build ironclad warships for the US Navy including the Monitor which was launched on January 30th 1862. In total the companies iron boats included 6 ferry boats, 3 steamboats and 9 ironclad gunboats. Following the decline of shipbuilding after the civil war, the company focused on building marine boilers and iron components for gas works.

A review of Sanborn maps shows the Site occupied by the Continental Iron Works in 1887 through 1916. It appears that the property was vacated sometime between 1916 and 1922. The property remained vacant till 1942 when the southeast corner was used by a lumber yard. Sometime between 1942 and 1951 the lumber yard was replaced by a machine shop and welding company which occupied a greater portion of the property. By 1965 the existing buildings were constructed and occupied by Associated Transport. Auto repair shops are identified in the east and west end of the building with a fueling station shown on the north side of the building. Associated Trucking was replaced by Consolidated Freightways in 1978 which occupied the property until the company filed for bankruptcy in 2002.

2.0 SUMMARY OF SITE REMEDY

2.1 REMEDIAL ACTION OBJECTIVES

The Remedial Action Objectives (RAOs) were identified for the Site as listed in the Decision Document dated November 24, 2015, are as follows:

2.1.1 Groundwater RAOs

RAOs for Public Health Protection

- Prevent ingestion of groundwater containing contaminant levels exceeding drinking water standards.
- Prevent contact with, or inhalation of, volatiles from contaminated groundwater.

RAOs for Environmental Protection

- Remove the source of ground or surface water contamination.

2.1.2 Soil RAOs

RAOs for Public Health Protection

- Prevent ingestion/direct contact with contaminated soil.

RAOs for Environmental Protection

- Prevent migration of contaminants that would result in groundwater or surface water contamination.

2.1.3 Soil Vapor

RAOs for Public Health Protection

- Mitigate impacts to public health resulting from existing, or the potential for, soil vapor intrusion into buildings at a site.

2.2 DESCRIPTION OF SELECTED REMEDY

The Site was remediated in accordance with the remedy selected by the NYSDEC in the Remedial Action Work Plan prepared by AMC in November 2015 and the Decision Document dated November 24, 2015. The factors considered during the selection of the remedy are those listed in 6NYCRR 375-1.8.

The following are the components of the selected remedy:

- Excavation of SVOC impacted soil/fill exceeding Protection of Groundwater SCOs from each of the six SVOC hot-spots;
- Collection and analysis of endpoint soil samples from each of the six SVOC hotspots to evaluate the performance of the remedy with respect to attainment of Protection of Groundwater SCOs;
- Excavation/removal of petroleum impacted soil/fill exceeding Restricted Residential and Protection of Groundwater SCOs from the former fueling area hotspot. The former fueling area hotspot excavation was approximately 180 feet long by 60 feet wide and was excavated to a depth of approximately 10 feet below grade;
- Collection and analysis of endpoint soil samples from the former fueling area hotspot to evaluate the performance of the remedy with respect to attainment of Restricted Residential and Protection of Groundwater SCOs;
- Removal of three underground storage tanks (one 5,000-gallon No. 2 fuel oil tank, and two 550-gallon oil tanks previously abandoned in place with water) and collection and analysis of endpoint soil samples to evaluate the performance of the remedy with respect to attainment of Restricted Residential and Protection of Groundwater SCOs;
- Screening for indications of contamination (by visual means, odor, and monitoring with PID) of all excavated soil during all intrusive Site work;
- Collection and analysis of end-point samples to evaluate the performance of the remedy with respect to attainment of Track 4 SCOs;
- Appropriate off-Site disposal of all material removed from the Site in accordance with all Federal, State, and local rules and regulations for handling, transport, and disposal;
- Dewatering and treatment of petroleum-impacted groundwater before discharging to the NYC sewer system under a NYCDEP sewer discharge permit;
- Import of clean native soil tested to meet Track 2 Residential SCOs to use as a minimum 2ft clean soil cover over a demarcation barrier. Import of the clean native soil was performed in compliance with: (1) chemical limitations and other specifications listed in the RAWP, and (2) all Federal, State, and local rules and regulations for handling and transport of material;

- Import of ¾" clean stone to be used as a sub-base below the asphalt pavement re-applied to cap portions of the Site, and as a structural backfill material below concrete footings installed for foundation of Building C and Building B in compliance with: (1) chemical limitations and other specifications listed in the RAWP, and (2) all Federal, State, and local rules and regulations for handling and transport of material;
- Construction of a site cover system consisting of the following:
  - Area of Future Building/Tower B – Patchwork of existing asphalt, existing concrete, newly applied asphalt pavement with/without a ¾" stone sub-base, and areas of new concrete (minimum of 2 inches thick) installed around steel piles installed for Building B;

    (To be replaced with a concrete slab for Tower B under the SMP)
  - Area of Future Portion of Building/Tower C to be Slab on Grade – A minimum of 2 inches of newly applied asphalt pavement with a ¾" stone sub-base, or a minimum of 2 inches of newly applied asphalt pavement without a sub-base;

    (To be replaced with a concrete slab for Tower C under the SMP)
  - Area of Future Cellar Building/Tower C to have Cellar - A minimum of 2 inches of newly poured concrete installed across the entire cellar area of Building C and the sloped excavation area along the west side of the excavation;

    (To be replaced with a concrete slab for Tower C under the SMP)
  - Area of Future Tower D to have Cellar – Patchwork of a minimum of 2 inches of asphalt installed after excavation/backfill of the loading dock, and newly applied asphalt pavement with/without a ¾" stone sub-base;

    (To be replaced with a concrete building slab for Tower D under the SMP)
  - Area of Future Roadway and Waterfront Public Access Area (Surcharge Area) – A minimum of 2 feet of clean soil over a demarcation barrier;

    (Under the SMP, trenched excavation will be performed within the surcharge areas to install new utilities. The surcharge areas will then be finished as roadways, sidewalks, and landscaped areas)
  - Pier/Waterfront Public Access Area (Asphalt) - A minimum of 2 inches of newly applied asphalt pavement with a ¾" stone sub-base, or a minimum of 2 inches of newly applied asphalt pavement without a sub-base;

(To be removed under the SMP and replaced with new walkways and/or landscaped areas)

- Recording of an Environmental Easement against the Site to ensure implementation of the SMP. Development and implementation of a Site Management Plan for long term management of remaining contamination as required by the Environmental Easement, which includes plans for: (1) Institutional and Engineering Controls, (2) monitoring, (3) operation and maintenance and (4) reporting.

3.0 INTERIM REMEDIAL MEASURES

3.1 INTERIM REMEDIAL MEASURES WORK PLAN (IRM)

The remedy for this site was performed as a single project, and no interim remedial measures, operable units or separate construction contracts were performed.

4.0 DESCRIPTION OF REMEDIAL ACTIONS PERFORMED

Remedial activities completed at the Site were conducted in accordance with the NYSDEC-approved Remedial Action Work Plan (RAWP) for the Former Consolidated Freightways Trucking Terminal site (November 2015). All deviations from the RAWP are noted below.

4.1 GOVERNING DOCUMENTS

4.1.1 Site Specific Health & Safety Plan (HASP)

The Health and Safety Plan for the implementation of remedial actions at the Former Consolidated Freightways Trucking Terminal was included as Attachment B of the Remedial Action Work Plan (RAWP) approved by the NYSDEC.

All remedial work performed under this Remedial Action was in full compliance with governmental requirements, including Site and worker safety requirements mandated by Federal OSHA. The Health and Safety Plan (HASP) was complied with for all remedial and invasive work performed at the Site.

4.1.2 Quality Assurance Project Plan (QAPP)

The QAPP was included as Attachment C of the Remedial Action Work Plan (RAWP) approved by the NYSDEC. The QAPP describes the specific policies, objectives, organization, functional activities and quality assurance/ quality control activities designed to achieve the project data quality objectives.

4.1.3 Construction Quality Assurance Plan (CQAP)

The Construction Quality Assurance Plan(s) (CQAPs) managed performance of the Remedial Action tasks through designed and documented QA/QC methodologies applied in the field and in the lab. The CQAP provided a detailed description of the observation and testing activities that were used to monitor construction quality and confirm that remedial construction was in conformance with the remediation objectives and specifications.

The following organizations and key personnel were involved in the implementation of the remedy:

Name	Title	Organization	Responsibilities
Mordy Hecht	Construction Manager	Halcyon Management Group, LLC	Scheduling and oversight of subcontractors and for implementation of the construction program.
Charles Sosik, P.G.	Environmental Project Manager	EBC	Coordination and oversight of day to day field activities, soil disposal, materials importation and UST removal.
Kevin Waters Brett Roberts Emily Wong Thomas Gallo Anthony Balado Jason Gellati Raymond Gallagher	QEP / SSO	EBC	On-Site soil screening, health and safety oversight and air monitoring. Preparation of daily and monthly status reports and updates to the RE.
Ariel Czemerinski P.E.	Remedial Engineer	AMC Engineering	Overall responsibility for implementation of the remedial plan.

All intrusive and soil disturbance activities were monitored by a QEP who recorded observations in the Site field book and kept a photographic log of the daily activities. The QEP provided daily updates to the Environmental Project Manager and Remedial Engineer (RE) who both made periodic visits to the Site as needed to assure construction quality. Soil samples were collected by the QEP who was on-Site daily during all soil disturbance activities. Waste characterization soil sample collection, analysis and frequency were made in accordance with the requirements of the disposal facility (Clean Earth of Carteret, Clean Earth of North Jersey, Clean Earth of Bethlehem, Bayshore Soil Management, LLC). Corrective measures, if required, were to be made in direct consultation with the representative of the selected disposal facility. Project coordination meetings were generally held in the on-Site construction trailer on a weekly basis and supplemented as conditions required. Meeting attendees over the course of the project varied according to need and may have included the following personnel:

- Construction Manager
- QEP/SSO
- Site Foreman / Supervisor
- Architect of Record
- Structural Engineer
- Environmental Project Manager
- Environmental Project Director
- Remedial Engineer

Daily status reports were prepared by the Environmental Project Manager in consultation with the QEP, and distributed to the project contact list via email. Copies of waste manifests, chain of custody documentation and air monitoring reports were placed in appropriately labeled binders which were kept in the job Site trailer. Photographic documentation was performed on a daily basis, included in the daily status reports, and periodically uploaded to the digital project file at the EBC office.

4.1.4 Soil/Materials Management Plan (S/MMP)

A Soil/Materials Management Plan (S/MMP) was included in the RAWP for excavation, handling, storage, transport and disposal of all soils/materials that were disturbed at the Site. The S/MMP provided detailed plans for managing all soils/materials that were disturbed at the Site, including excavation, handling, storage, transport and disposal. It also included all of the controls that were applied to these efforts to assure effective, nuisance free performance in compliance with all applicable Federal, State and local laws and regulations.

The S/MMP specified the following methods to meet the performance objectives:

- Soil Screening Methods - Visual, olfactory and PID soil screening and assessment was performed by a QEP during all remedial and development excavations into known or potentially contaminated material (Residual Contamination Zone).

- Stockpile Methods - Stockpiles were kept covered at all times with appropriately anchored tarps and inspected daily to ensure the covers were maintained and fugitive dust emissions did not occur. Soil was separated into separate piles based on the soil screening performed by the QEP. The soil pile classifications included non-hazardous historic fill material, petroleum contaminated soil and clean native soil. In-Situ waste characterization soil samples were collected for each of the soil classifications prior to excavation and stockpiling in accordance with the frequency and parameters required by the soil disposal facility and/or NYSDEC DER-10.

- Materials Excavation and Load Out - The QEP under the supervision of the RE was on-Site on a daily basis to oversee all invasive work and the excavation and load-out of all excavated material. Loaded vehicles leaving the Site were appropriately lined, tarped,

securely covered, manifested, and placarded in accordance with appropriate Federal, State and local requirements. A truck pad was located at the egress point of the Site and all outbound trucks were inspected and cleaned, as required to remove loose soils before leaving the Site. The adjacent streets were inspected and cleaned as needed with respect to Site -derived materials.

- Materials Transport Off-Site - All transport of materials was performed by licensed haulers in accordance with appropriate local, State, and Federal regulations. Truck transport routes were determined prior to construction and a map of the route was posted at the egress points of the Site. All trucks loaded with Site materials exited the vicinity of the Site using the approved truck routes. The identified route was selected to limit transport through residential areas and past sensitive sites and comply with City-mapped truck routes.

- Materials Disposal Off-Site - All petroleum impacted soil, and historic fill material was treated as a contaminated and regulated material and was disposed in accordance with all local, State and Federal regulations. Non-hazardous waste manifests were used to track and document the off-Site movement of non-hazardous wastes and petroleum contaminated soils. Hazardous waste manifests were used to track and document the off-Site movement of historic fill material characterized as hazardous for lead - D008. Waste characterization was performed for off-Site disposal in accordance with the requirements of the receiving facility and in conformance with applicable permits. Waste characterization data was provided to the receiving facility and approved in writing by the facility prior to off-Site shipment. A summary of off-Site disposal is provided in Table 2. A summary of waste characterization sampling results is provided in Tables 13 through 20. Hazardous waste manifests are provided in Appendix J (Clean Earth of North Jersey), and non-hazardous waste disposal manifests are provided in Appendix K (Clean Earth of Carteret), Appendix L (Clean Earth of Bethlehem), and Appendix M (Bayshore Soil Management, LLC).

- Fluids Management - Construction wastewater generated from surface runoff was minimized and directed back toward the interior of the Site and the excavation.

- Backfill from Off-Site Sources - Virgin-mined ¾" blue stone was imported to the Site for use as a sub-base below the asphalt pavement re-applied to cap portions of the Site, and as a structural backfill material below concrete footings installed for foundation of Building C and Building B. In accordance with DER-10, this material was exempt from chemical analysis. All materials proposed for import onto the Site were previously approved by the Remedial Engineer and the NYSDEC in accordance with the S/MMP. See Appendix P1 through Appendix P5 for documentation on this material.

  Virgin-mined ¾" blue stone, as well as larger stone (2-½" stone, 18" stone, 3 to 5" stone, 2 to 6" stone, Rip Rap, and 12 to 24" stone) were imported for use as backfill off-Site along the waterfront bulkhead.

  Clean native soil from nine separate sources was imported to the Site to backfill the over excavated raised terminal platform building area, and to create the soil surcharge area across the Site. All materials proposed for import onto the Site were previously approved by the Remedial Engineer and the NYSDEC in accordance with the S/MMP. See Appendix O1 through Appendix O9 for documentation on this material.

- After the completion of soil removal and other invasive remedial activities and prior to backfilling, a land survey was performed by a New York State licensed surveyor. See Figure 3. A land survey was also performed after the demarcation barrier was installed and after the surcharge (clean soil) was installed over the demarcation barrier. See Figure 5.

- Contingency Plan - The contingency plan specified procedures to document and notify the NYSDEC in the event that underground tanks or other previously unidentified contaminant sources were found during on-Site remedial excavation or development related construction. A total of three underground storage tanks were encountered during excavation of the Site. The three tanks included the following:
  - One 5,000-gallon No. 2 fuel oil underground storage tank was removed (Noted as Tank No. HO-1 on the PBS Database under Site No. 2-603899),
  - Two 550-gallon gasoline underground storage tanks previously abandoned in

place with water was removed (Noted as Tank No. 2 and Tank No. 3 on the PBS Database under Site No. 2-603899),

The three underground storage tanks were removed in accordance with tank removal requirements outlined within the RAWP.

- Community Air Monitoring - The S/MMP specified air monitoring during implementation of each component of the Remedial Action to provide a measure of protection for the downwind community from potential airborne contaminant releases as a direct result of investigative or remedial work activities. As described in Section 4.1.6, the project QEP performed daily monitoring around the perimeter of the property for volatile organic compounds and dust particulates. No exceedances in downwind CAMP action levels were recorded during the remedial action that were associated with on-site remedial activities.

Odor, Dust and Nuisance Control - Dust control was accomplished by spraying water on exposed soil surfaces to ensure that perimeter action levels established in the CAMP were not exceeded. No work zone or perimeter action level exceedances were detected, with the exception of those noted above. Nuisance odors were not encountered.

4.1.5 Storm-Water Pollution Prevention Plan (SWPPP)

This document addressed requirements of New York State Storm-Water Management Regulations including physical methods to control and/or divert surface water flows and to limit the potential for erosion and migration of Site soils, via wind or water.

The erosion and sediment controls for all remedial construction were performed in conformance with requirements presented in the New York State Guidelines for Urban Erosion and Sediment Control and the site-specific Storm Water Pollution Prevention Plan.

Typical measures that were utilized at various stages of the project to limit the potential for erosion and migration of soil included the use of temporary stabilized construction entrances/exits and dust control measures. Construction entrances were stabilized with a RCA

base and sloped back toward the interior of the lot. Therefore, all stormwater was retained on Site and directed toward the interior of the Site to be pumped into the dewatering system.

4.1.6 Community Air Monitoring Plan (CAMP)

The Community Air Monitoring Plan (CAMP) provided measures for the protection of the surrounding and downwind community (i.e., off-Site receptors including residences, businesses, and on-Site workers not directly involved in the remedial work) from potential airborne contaminant releases resulting from remedial activities. The action levels specified required increased monitoring, corrective actions to abate emissions, and/or work shutdown. Additionally, the CAMP helps to confirm that the remedial work did not spread contamination off-Site through the air. The primary concerns for the Site were VOCs, nuisance odors and dust particulates.

To comply with the requirements of the CAMP, the project QEP performed daily monitoring around the perimeter of the property for volatile organic compounds and dust particulates. CAMP monitoring was performed utilizing CAMP stations which included a DustTrack™ II Aerosol Monitor 8530, and a RAE Systems MiniRAE 3000 photoionization detector. No exceedances in CAMP action levels were recorded during the remedial action. Daily CAMP monitoring data sheets are included in Appendix C.

4.1.7 Contractors Site Operations Plans (SOPs)

The Remediation Engineer reviewed all plans and submittals for this remedial project (i.e. those listed above plus contractor and subcontractor submittals) and confirmed that they were in compliance with the RAWP. All remedial documents were submitted to NYSDEC and NYSDOH in a timely manner and prior to the start of work.

4.1.8 Community Participation Plan

The approved Citizen Participation Plan for this project specified the following document repositories for all applicable project documents for the duration of the project:

Brooklyn Public Library
107 Norman Avenue
Brooklyn, New York 11222
Telephone (718) 349-8504

NYSDEC Region 2 Office

Hunter's Point Plaza

47-40 21st Street

Long Island City, NY 11101

(718) 482-4900

Fact sheets notifying the public of project milestones and of the availability of documents for review and comment were sent to the site contact list in accordance with the Citizen Participation requirements of the NYS Brownfield Cleanup Program. Remaining citizen participation elements will include the distribution of a fact sheet to the site contact list when the Certificate of Completion (COC) is issued.

4.2 REMEDIAL PROGRAM ELEMENTS

4.2.1 Contractors and Consultants

- Halcyon Management Group, LLC
  - General Contractor for the Site
  - Performed all excavation work
  - Supervised, scheduled and coordinated subcontractors
  - Project budgeting
- ABC Tank Repair & Lining, Inc.
  - Underground storage tank cleaning and off-Site disposal
  - Removal of fluid and sludge within the tanks
- Environmental Business Consultants
  - Environmental Consultant
  - Qualified Environmental Professional
  - Perform health and safety and CAMP monitoring
  - Performed soil screening and waste characterization sampling
  - Document remedial program
  - Reporting (Daily, Monthly)
- AMC Engineering
  - Remedial Engineer
  - Performed periodic inspections of work / methods

- Certified Compliance with RAWP and associated plans
- Certified Compliance with FER and associated plans

4.2.2 Site Preparation

The Remedial Action Work Plan was formally approved by the NYSDEC by letter dated November 24, 2015. The New York City Office of Environmental Remediation (OER) issued a Notice of Proceed (NTP) for Tower C to the Brooklyn Borough Commissioner of the NYC Department of Buildings (DOB) on November 30, 2015. The New York City Office of Environmental Remediation (OER) issued a Notice of Proceed (NTP) for Tower B to the Brooklyn Borough Commissioner of the NYC Department of Buildings (DOB) on March 13, 2018. Separate issuance and receipt of the NTP is required before building permits are released by the DOB. Documentation of NYSDEC approvals is included in **Appendix D**. Other non-agency permits relating to the remediation project are provided in **Appendix E**. The following permits were issued for this project.

Appendix E IDs	*Permit*	*Permit Number*	*Originating Agency*	*Issued*	*Expires*
1A	OER Notice to Proceed	OER Project 14EH-N420K	NYC OER	11/30/2015	N/A
1B	OER Notice to Proceed	OER Project 18EH-N314K	NYC OER	03/13/2018	N/A
2	Waterfront Outfall/Intake Structures	NAN-2016-01322	Dept of Army	02/02/2018	02/02/2021
3	Tidal Wetlands	2-6101-01372/00001	NYSDEC	4/26/2017	12/31/2022

All CEQR requirements and all substantive compliance requirements for attainment of applicable permits were achieved during this Remedial Action.

Site preparation began with excavating and capping the sewer lines and water lines in the sidewalks adjacent to the property and erection of a construction fence in preparation for demolition work. A pre-construction meeting was held with the NYSDEC on December 9, 2015, which included the RE, Environmental Project Manager and Field Manager, Construction Manager, GC, and the excavation contractor.

Mobilization for remedial work occurred the following week in December 2015, and included set up of the SWPP protective measures, and the delivery of heavy equipment and jobsite tools. Excavation was completed by September 2019.

4.2.3 General Site Controls

Security of the Site was maintained by a construction fence erected around the perimeter of the Site, and a gates at the front entrance/egress point which was locked at the end of each work day. Job Site record keeping included a daily sign-in sheet, daily air monitoring logs, waste manifests, accident reports, field notes and photographic documentation. All project forms, logs and reciepts were filed on-Site in dedicated binders kept in the construction trailer. Field notes and observations were recorded in a project-dedicated field book which remained on-Site in the construction trailer. Photogaphic documentation was up-loaded on a daily basis to a laptop computer which remained in the possesion of the QEP.

Erosion and sediment controls included a silt fence stapled to the inside of the construction fence, the truck pad located at the exit of the Site, and the truck washing area / stabilized construction entrance located at the exit of the Site. The truck washing area was inspected following useage and storm events and regraded and maintained as needed. The truck washing area / stabilized construction entrance consisted of a bed of recycled concrete aggregate installed over the asphalt of the former parking lot, and a high pressure hose connected to a fire hydrant. The hose was used to wash the tires, sides and underside of each truck before it exited the Site.

Soil screening was performed by the project QEP during excavation of all on-Site soil to identify and delineate the lead hot-spot, potential petroleum contamination, historic fill material and native soil to allow for segregation of soil into appropriate stockpiles for off-Site disposal at the appropriate/designated facilities. Soil stockpiles were covered with appropriately anchored tarps until disposal facility arrangements were made and soil load out occurred. Soil stockpile covers were inspected daily and after each storm event.

4.2.4 Odor, Dust and Nuisance Control Plan

The S/MMP specified that dust would be controlled by wetting the work area and use of RCA roadways. Dust generation was minimal during most excavation work.

The stabilized construction entrance was maintained by regrading and adding RCA as needed to maintain a clean condition. The street and sidewalk areas were inspected following truck

departure and broom swept as needed to maintain a clean condition. Nuisance odors were not observed.

The selected truck route minimized traffic on neighborhood streets, and followed the NYCDOT-approved truck routes. The truck route map was enlarged and mounted at both Site access gates to notify all drivers.

4.2.5 CAMP Results

Air monitoring was performed on a daily basis at the site boundaries and the work zone for dust and VOCs in accordance with the Community Air Monitoring Plan. No exceedances in downwind CAMP action levels were recorded during the remedial action that were associated with on-site remedial activities. However, several CAMP exceedances were reported to the DEC, as described above in Section 4.1.4. Copies of all field data sheets relating to the CAMP are provided in electronic format in Appendix C.

4.2.6 Reporting

In accordance with the approved RAWP, daily status reports were prepared and submitted to the NYSDEC and the project team. Daily reports included a listing of contractors, personnel and equipment on-Site, description of activities performed by contractors, CAMP monitoring results, materials imported/exported to/from the Site and planned activities for the following day.

Monthly project status reports were prepared by the EBC Project Manager and distributed to the NYSDEC and project team. Monthly reports included a summary of the activities performed during the month and those anticipated during the next month, a summary of materials transported on to and off the Site during the month, sampling results and delays in the schedule.

All daily reports are included in electronic format in Appendix F and all monthly status reports are included in electronic format in Appendix G. The digital photo log required by the RAWP is included in electronic format in Appendix H.

4.3 CONTAMINATED MATERIALS REMOVAL

Materials removed from the Site during the remediation project included asphalt covering parking areas that required excavation for redevelopment, concrete from the former raised

terminal platform building, foundation walls, footings and structures associated with former buildings, D008 Hazardous Lead soil from a lead hot spot located within the raised terminal platform building (loading dock), non-hazardous soil/fill from the former raised terminal platform building (loading dock), petroleum contaminated soil from the Former Fueling Area Hotspot, historic fill material and native soil for construction of the cellar of new Building C, SVOC impacted soil from six SVOC hotspots, and non-hazardous soil/fill from several areas of the Site to allow for installation of a 2ft clean soil cap.

The Track 4 cleanup included excavation/removal of petroleum impacted soil from the 180 ft by 60 ft Former Fueling Area Hotspot to a depth of 10 feet, and excavation/removal of SVOC impacted soil to depth of 3 feet from each of the six SVOC hotspots to meet Protection of Groundwater SCOs. The implemented remedy included the following:

- Excavation of SVOC impacted soil/fill exceeding Protection of Groundwater SCOs from each of the six SVOC hot-spots;
- Collection and analysis of endpoint soil samples from each of the six SVOC hotspots to evaluate the performance of the remedy with respect to attainment of Protection of Groundwater SCOs;
- Excavation/removal of petroleum impacted soil/fill exceeding Restricted Residential and Protection of Groundwater SCOs from the former fueling area hotspot. The former fueling area hotspot excavation was approximately 180 feet long by 60 feet wide and was excavated to a depth of approximately 10 feet below grade;
- Collection and analysis of endpoint soil samples from the former fueling area hotspot to evaluate the performance of the remedy with respect to attainment of Restricted Residential and Protection of Groundwater SCOs;
- Removal of three underground storage tanks (one 5,000-gallon No. 2 fuel oil tank, and two 550-gallon oil tanks previously abandoned in place with water) and collection and analysis of endpoint soil samples to evaluate the performance of the remedy with respect to attainment of Restricted Residential and Protection of Groundwater SCOs;
- Screening for indications of contamination (by visual means, odor, and monitoring with PID) of all excavated soil during all intrusive Site work;

- Collection and analysis of end-point samples to evaluate the performance of the remedy with respect to attainment of Track 4 SCOs;
- Appropriate off-Site disposal of all material removed from the Site in accordance with all Federal, State, and local rules and regulations for handling, transport, and disposal;
- Dewatering and treatment of petroleum-impacted groundwater before discharging to the NYC sewer system under a NYCDEP sewer discharge permit;
- Import of clean native soil tested to meet Track 2 Residential SCOs and Protection of Groundwater SCOs to backfill the cellar of the former 2-story building's cellar, backfill the SVOC hotspots and Former Fueling Area Hotspot, and to use as a minimum 2ft clean soil cover over a demarcation barrier. Import of the clean native soil was performed in compliance with: (1) chemical limitations and other specifications listed in the RAWP, and (2) all Federal, State, and local rules and regulations for handling and transport of material;
- Construction of a site cover system consisting of the following:
  - Area of Future Building/Tower B – Patchwork of existing asphalt, existing concrete, newly applied asphalt pavement with/without a ¾" stone sub-base, and areas of new concrete (minimum of 2 inches thick) installed around steel piles installed for Building B;

    (To be replaced with a concrete slab for Tower B under the SMP)
  - Area of Future Portion of Building/Tower C to be Slab on Grade – A minimum of 2 inches of newly applied asphalt pavement with a ¾" stone sub-base, or a minimum of 2 inches of newly applied asphalt pavement without a sub-base;

    (To be replaced with a concrete slab for Tower C under the SMP)
  - Area of Future Cellar Building/Tower C to have Cellar - A minimum of 2 inches of newly poured concrete installed across the entire cellar area of Building C and the sloped excavation area along the west side of the excavation;

    (To be replaced with a concrete slab for Tower C under the SMP)
  - Area of Future Tower D to have Cellar – Patchwork of a minimum of 2 inches of asphalt installed after excavation/backfill of the loading dock, and newly applied asphalt pavement with/without a ¾" stone sub-base;

    (To be replaced with a concrete building slab for Tower D under the SMP)

- Area of Future Roadway and Waterfront Public Access Area (Surcharge Area) – A minimum of 2 feet of clean soil over a demarcation barrier;

  (Under the SMP, trenched excavation will be performed within the surcharge areas to install new utilities. The surcharge areas will then be finished as roadways, sidewalks, and landscaped areas)
- Pier/Waterfront Public Access Area (Asphalt) - A minimum of 2 inches of newly applied asphalt pavement with a ¾" stone sub-base, or a minimum of 2 inches of newly applied asphalt pavement without a sub-base;

  (To be removed under the SMP and replaced with new walkways and/or landscaped areas)

- Import of ¾" clean stone to be used as a sub-base below the asphalt pavement re-applied to cap portions of the Site, and as a structural backfill material below concrete footings installed for foundation of Building C and Building B in compliance with: (1) chemical limitations and other specifications listed in the RAWP, and (2) all Federal, State, and local rules and regulations for handling and transport of material;
- Implementation of a Site Management Plan (SMP) to ensure maintenance of the Engineering Controls; and
- Recording of an Environmental Easement against the Site to ensure implementation of the SMP.

A list of the Track 1 Unrestricted Use Soil Cleanup Objectives (SCOs), Restricted Residential SCOs, Protection of Groundwater SCOs, and Commercial SCOs for the contaminants of concern for this project is provided as Table 1. A figure (final excavation survey) depicting the location of original sources and areas where excavations were performed is provided as Figure 3.

Work at the Site began in December 2015, and consisted of the installation four pilings and the collection of waste characterization soil samples from the former terminal platform building (loading dock). June 6, 2016, began the delivery of clean native soil from other redevelopment projects to backfill the former 2-story building's cellar. A truck wash and truck pad were installed. In November of 2016, test piles were installed to provide information necessary to design the foundations of the new buildings. Excavation/removal of the raised terminal platform building (loading dock) began in March 2017.

4.3.1 Waste Characterization Sampling

4.3.1.1 Loading Dock and SV3, SV4, and SV5 Waste Characterization Sampling (12/2015)

In order to collect waste characterization soil samples from the soil/fill that required excavation/removal from the raised terminal platform building and three of the SVOC Hotspots (HS3, HS4, and HS5), EBC divided the area of the raised terminal platform building into 8 equal grid sections (Grid Sections A through H). Four soil borings were performed within each of the 8 grid sections to a depth of 5 feet below grade using a five-foot steel macro-core sampler with acetate liners and Geoprobe direct-push equipment. From the four soil borings performed within each grid section, EBC formed one 5-point composite waste characterization soil sample representing soil/fill from 0 to 5 feet below grade. In addition, EBC retained two grab soil samples from each grid section for laboratory analysis of VOCs. Each of the composite waste characterization soil samples were collected in laboratory provided glassware and submitted to Phoenix Environmental Laboratories, Inc. for laboratory analysis of SVOCs, pesticides, PCBs, TCLP metals, RCRA metals, and RCRA characteristics.

Disposal Facility Approvals

Based on the laboratory results of the waste characterization soil samples, Clean Earth of Carteret approved all of the soil/fill to be excavated from Grid Sections A through H from the former raised terminal platform building. Clean Earth of Carteret (CEC) is located in Carteret, NJ. The CEC facility (ID# 13231) is a Class B Recycling Center operating under permit No. CBG060003 issued by the New Jersey Department of Environmental Protection (NJDEP). A copy of the formal soil disposal request letter prepared by EBC, and a copy of the formal soil disposal acceptance letter prepared by CEC is included in Appendix K.

Supplemental Waste Characterization of Grid Sections A and B

Following excavation and off-Site disposal of soil/fill from Grid Sections C through H, Clean Earth of Carteret requested the collection and laboratory analysis of four additional waste characterization soil samples to obtain disposal approval of the remaining soil/fill from Grid Sections A and B. In order to collect the four additional waste characterization samples, Grid Sections A and B were both divided into two sections (A1, A2, B1, and B2). On March 28, 2017, EBC formed 5-point composite waste characterization soil samples from test pits representing 0 to 5 feet below grade within grid sections A, A2, B1 and B2. In addition, EBC retained a grab

soil sample from each grid section for laboratory analysis of VOCs. Each of the composite waste characterization soil samples were collected in laboratory provided glassware and submitted to Phoenix Environmental Laboratories, Inc. for laboratory analysis of SVOCs, pesticides, PCBs, TCLP metals, RCRA metals, and RCRA characteristics. The laboratory results of waste characterization soil samples noted a TCLP lead concentration greater than the EPA TCLP Regulatory Levels. Delineation soil sampling performed in April and May of 2018, limited the D008 Hazardous Lead soil/fill area to a portion of the A2 grid section and a small area that extended into the northwest corner of the B1 grid section.

Disposal Facility Approvals

Based on the waste characterization soil samples, Clean Earth of North Jersey accepted D008 Hazardous Lead soil/fill from Grid Sections A1, A2, and B1. Clean Earth of North Jersey is located at 115 Jacobus Avenue, Kearny, NJ 07032. The facility is a RCRA Part B permitted transfer, storage and disposal facility (TSDF) that accepts hazardous and industrial waste under New Jersey Permit No. NJD991291105. A copy of the formal soil disposal request letter prepared by EBC, and a copy of the formal soil disposal acceptance letter prepared by CENJ is included in Appendix J. The non-hazardous soil/fill located outside of the area designated as the D008 Hazardous Lead soil/fill hotspot, as approved for transport to Bayshore Soil Management, LLC. (Bayshore) is located at 75 Crows Mill Road, Keasbey, NJ. Bayshore Soil Management, LLC is registered as a NJDEP Recycling Center for Class B Materials, including petroleum contaminated soil (Permit No. CBG110004). A copy of the formal soil disposal request letter prepared by EBC, and a copy of the formal soil disposal acceptance letter prepared by Bayshore is included in Appendix M.

4.3.1.2 Former Fueling Area Hotspot Waste Characterization Sampling (12/2015)

Initial Waste Characterization Sampling Event – January 19, 2017

On January 19, 2017, EBC performed three soil borings within the Former Fueling Area to a depth of 5 feet below grade using a five-foot steel macro-core sampler with acetate liners and Geoprobe direct-push equipment. The location of the Former Fueling Area Hotspot and each of the three soil borings is shown on waste characterization sampling figure attached to the formal soil disposal request letter included in Appendix K. From the three soil borings, EBC formed one 6-point composite waste characterization soil sample representing 0 to 5 feet below grade and

one 5-point composite waste characterization soil sample representing the interval 5 to 10 feet below grade. In addition, EBC retained one worst case grab soil sample for laboratory analysis of VOCs and TPH from the 0 to 5 and 5 to 10 ft intervals. Both of the 6-pt composite waste characterization soil samples were collected in laboratory provided glassware and submitted to Phoenix Environmental Laboratories, Inc. for laboratory analysis of SVOCs, pesticides, PCBs, TCLP metals, RCRA metals, and RCRA characteristics.

Delineation Soil Sampling Event – January 27, 2017

Based on delineation soil sampling performed on January 19, 2017, it was determined that the Fuel Area – FA hotspot was larger than originally proposed. Therefore, on January 27, 2017, EBC performed an additional nine soil borings (FA10, FA11, FA13, F14, and FA16 to FA20) to determine the horizontal and vertical extent of the petroleum contamination. One soil sample was collected from each of the nine soil borings from the intervals 6 to 8 ft below grade or 8 to 10 ft below grade. The nine soil samples were collected in laboratory provided glassware and submitted to Phoenix Environmental Laboratories, Inc. for laboratory analysis of VOCs and SVOCs.

Final Waste Characterization Sampling Event – May 2, 2017

Based on the delineation soil sampling events performed in January 2017, it was determined that the Former Fueling Hotspot area was approximately 70 ft by 200 ft and approximately 10 feet deep. EBC divided the Former Fueling Hotspot area into 5 equal grid sections (FA1, FA2, FA3, FA4, and FA5). On May 2, 2017, EBC performed 5 soil borings within each of the five grid sections. From the five soil borings performed within each grid section, EBC formed one 5-point composite soil representing the interval 0 to 5 feet below grade, and one 5-point composite waste characterization soil sample representing the interval 5 to 10 feet below grade. In addition, EBC retained one worst case grab sample from each interval for laboratory analysis of VOCs.

The ten 5-point composite waste characterization soil samples were collected in laboratory provided glassware and submitted to Phoenix for laboratory analysis of SVOCs, pesticides, PCBs, TCLP metals, RCRA metals, and RCRA characteristics.

Disposal Facility Approvals

Based on the laboratory results of the waste characterization soil samples, Clean Earth of Carteret approved all of the soil/fill to be excavated from the Former Fueling Area Hotspot. Clean Earth of Carteret (CEC) is located in Carteret, NJ. The CEC facility (ID# 13231) is a Class B Recycling Center operating under permit No. CBG060003 issued by the New Jersey Department of Environmental Protection (NJDEP). A copy of the formal soil disposal request letter prepared by EBC, and a copy of the formal soil disposal acceptance letter prepared by CEC is included in Appendix K.

4.3.1.3 SVOC Hotspots HS1, HS2, HS6 - Waste Characterization Sampling (1/2017)

On January 19, 2017, EBC performed one soil boring within each of the three small SVOC hotspots to a depth of 3 feet below grade using a five-foot steel macro-core sampler with acetate liners and Geoprobe direct-push equipment. The location of the HS1, HS2, and HS6 SVOC Hotspots and the three soil borings is shown on waste characterization sampling figure attached to the formal soil disposal request letter included in Appendix K. From the soil recovered from each soil boring, EBC formed a 5-point composite waste characterization soil sample representative of the soil/fill to be excavated from the hotspot. In addition, EBC retained one worst case grab soil sample for laboratory analysis of VOCs. The three grab soil samples and the three 5-point composite waste characterization soil samples were collected in laboratory provided glassware and submitted to Phoenix Environmental Laboratories, Inc. for laboratory analysis of SVOCs, pesticides, PCBs, TCLP metals, RCRA metals, and RCRA characteristics.

Disposal Facility Approvals

Based on the laboratory results of the waste characterization soil samples, CEC approved all of the soil/fill to be excavated from the HS1, HS2, and HS6 SVOC Hotspots. A copy of the formal soil disposal request letter prepared by EBC, and a copy of the formal soil disposal acceptance letter prepared by CEC is included in Appendix K.

4.3.1.4 Building C Cellar Excavation - Waste Characterization Sampling (1/2017)

In order to collect waste characterization soil samples that were representative of the soil to be excavated for the cellar level of Building C, the area was divided into 3 colored grid sections (Red, Blue, and Yellow). Within each of the 3 grid sections, five soil borings were performed to

a depth of 16 feet below grade using a track-mounted Geoprobe Model 7822DT with a 5 ft long steel macro-core sampler with disposable acetate liners. From the five soil borings performed within in Red, Blue and Yellow grid sections, EBC formed 5-point composite soil samples representing the intervals 0 to 2 feet below grade, 2 to 4 feet below grade, 4 to 8 feet below grade, 8 to 12 feet below grade, and 12 to 16 feet below grade. In addition, EBC retained one worst case grab soil sample for laboratory analysis of VOCs. The grid sections and the soil borings performed within each grid section, is shown on waste characterization sampling figure attached to the formal soil disposal request letter included in Appendix L. The 15 grab soil samples and the fifteen 5-point composite waste characterization soil samples were collected in laboratory provided glassware and submitted to Phoenix Environmental Laboratories, Inc. for laboratory analysis of SVOCs, pesticides, PCBs, TCLP metals, RCRA metals, and RCRA characteristics.

Disposal Facility Approvals

Based on the laboratory results of the waste characterization soil samples, Clean Earth of Bethlehem approved all of the soil/fill to be excavated for the cellar of Building C. Clean Earth of Bethlehem (CEB) is located at 3000 Commerce Center Boulevard, Bethlehem, Pennsylvania 18015. The CEB facility is a beneficial use site permitted to accept Regulated Fill under PADEP General Permit No. WMGR096-NE004. A copy of the formal soil disposal request letter prepared by EBC, and a copy of the formal soil disposal acceptance letter prepared by CEB is included in Appendix L.

4.3.1.5 Stormwater Sewer Connection Trench - Waste Characterization Sampling (8/2019)

1st Soil Stockpile

In early August 2019, soil/fill was excavated from a trench beginning at the West Street sidewalk and extending approximately 150 feet into the Site. A stockpile of soil/fill approximately 185 cubic yards in size was generated by excavating the trench. On August 13, 2019, EBC collected five grab soil samples from the stockpile to form one 5-point composite soil sample. One of the grab soil samples was retained for laboratory analysis of VOCs. The 5-point composite soil sample was collected in laboratory provided glassware and submitted to Phoenix Environmental Laboratories, Inc. for laboratory analysis of SVOCs, pesticides, PCBs, TCLP metals, EPH, TAL metals, and RCRA characteristics.

2nd Soil Stockpile

A second stockpile approximately 325 cubic yards in size was generated as the stormwater sewer connection trench expanded to the west. On August 13, 2019, EBC collected five grab soil samples from the stockpile to form one 5-point composite soil sample. One of the grab soil samples was retained for laboratory analysis of VOCs. The 5-point composite soil sample was collected in laboratory provided glassware and submitted to Phoenix Environmental Laboratories, Inc. for laboratory analysis of SVOCs, pesticides, PCBs, TCLP metals, EPH, TAL metals, and RCRA characteristics.

Disposal Facility Approvals

Based on the laboratory results of the waste characterization soil samples, Clean Earth of Bethlehem approved soil/fill from the both the 1st and 2nd soil stockpiles generated by excavating for the stormwater connection. A copy of the formal soil disposal request letter prepared by EBC, and a copy of the formal soil disposal acceptance letter prepared by CEB is included in Appendix L.

4.3.1.6 Soil Removal to Install 2ft Clean Soil Cap - Waste Characterization Sampling

C4/D4 Boundary

On August 18, 2019, an approximate 80 ft by 80 ft area was excavated at the boundary of the C4/D4 grid sections to the southern property line to allow for installation of a cap consisting of a demarcation barrier and 2 feet of clean soil. The daily status report and labeling for the sample incorrectly identify the area as Grid Section D3. Soil/fill excavated from the 0 to 2 ft interval was stockpiled in one stockpile, and the soil excavated from the 2 to 3 ft interval was stockpiled as a second stockpile.

On August 24, 2019, EBC collected five grab soil samples from the 0 to 2ft soil stockpile, and five grab soil samples from the 2 to 3 ft soil stockpile. EBC formed a 5-point composite soil sample representative for each of the stockpiles using the grab soil samples. One of the grab soil samples from each stockpile was retained for laboratory analysis of VOCs. The 5-point composite soil sample was collected in laboratory provided glassware and submitted to Phoenix Environmental Laboratories, Inc. for laboratory analysis of SVOCs, pesticides, PCBs, herbicides, TCLP metals, EPH, TAL metals, and RCRA characteristics.

B4

On July 5, 2018, the top 1 to 2 feet of soil/fill was excavated from two adjacent areas within the B4 grid section to allow for installation of a cap consisting of a demarcation barrier and 2 feet of clean soil. A stockpile estimated to be approximately 400 cubic yards was generated.

On July 5, 2019, EBC collected formed a 5-point composite soil sample representative of the soil stockpile and retained a grab soil sample for laboratory analysis of VOCs. The 5-point composite soil sample was collected in laboratory provided glassware and submitted to Phoenix Environmental Laboratories, Inc. for laboratory analysis of SVOCs, pesticides, PCBs, herbicides, TCLP metals, EPH, TAL metals, and RCRA characteristics.

E2/West Street Boundary

On August 20, 2019, an approximate 65 ft by 90 ft area was excavated to a depth ranging from approximately 2 at the West Street property line to approximately 0.5 feet on the western end of the excavation. The excavation was performed within the E2 grid section to allow for installation of a cap consisting of a demarcation barrier and 2 feet of clean soil. Soil/fill excavated the area was stockpiled.

On August 24, 2019, EBC collected five grab soil samples from the stockpile and formed a 5-point composite soil sample representative of the stockpile using the grab soil samples. One of the grab soil samples was retained for laboratory analysis of VOCs. The 5-point composite soil sample was collected in laboratory provided glassware and submitted to Phoenix Environmental Laboratories, Inc. for laboratory analysis of SVOCs, pesticides, PCBs, herbicides, TCLP metals, EPH, TAL metals, and RCRA characteristics.

Disposal Facility Approvals

Based on the laboratory results of the waste characterization soil samples, Clean Earth of Cartert approved soil/fill from all three soil stockpiles generated by removing soil from Grid Section E2 and the boundary of the C4/D4 grid sections, and the stockpile generated by excavating within Grid Section B4. A copy of the formal soil disposal request letter/emails prepared by EBC, and a copy of the formal soil disposal acceptance letter prepared by CEC is included in Appendix K.

4.3.1.7 Waterfront/Shoreline - Waste Characterization Sampling (8/2019)

Onsite Waterfront - SB Comp (0-5) and SB Comp (5-10)

On August 17, 2018, EBC performed five soil borings within the on-Site portion of the waterfront that required excavation to construct the shoreline bulkhead along the west side of the Site. Each of the five soil borings were performed to a depth of 10 feet below grade using a five-foot steel macro-core sampler with acetate liners and Geoprobe direct-push equipment. The proposed excavation location for the shoreline bulkhead and each of the five soil borings is shown on waste characterization sampling figure attached to the formal soil disposal request letter included in Appendix K. From the five soil borings, EBC formed one 5-point composite waste characterization soil sample representing 0 to 5 feet below grade and one 5-point composite waste characterization soil sample representing the interval 5 to 10 feet below grade. In addition, EBC retained one worst case grab soil sample for laboratory analysis of VOCs from the 0 to 5 and 5 to 10 ft intervals. Both of the 5-point composite waste characterization soil samples were collected in laboratory provided glassware and submitted to Phoenix Environmental Laboratories, Inc. for laboratory analysis of SVOCs, pesticides, herbicides, PCBs, TCLP metals, RCRA metals, EPH, and RCRA characteristics.

Off-Site – Shorefront Comp

On August 17, 2018, five test pits were excavated off-Site in the area that required excavation to construct the shoreline bulkhead along the west side of the Site. Each of the test pits were performed to a depth of 10 feet below grade. The proposed excavation location for the shoreline bulkhead and each of the five test pits is shown on waste characterization sampling figure attached to the formal soil disposal request letter included in Appendix K. From the five test pits, EBC formed one 5-point composite waste characterization soil sample representing the soil/fill that required removal. In addition, EBC retained one worst case grab soil sample for laboratory analysis of VOCs. The 5-point composite waste characterization soil sample was collected in laboratory provided glassware and submitted to Phoenix Environmental Laboratories, Inc. for laboratory analysis of SVOCs, pesticides, herbicides, PCBs, TCLP metals, RCRA metals, EPH, and RCRA characteristics.

Northern Shoreline On/Off-Site – Waterfront North/Shoreline North

Following excavation and off-Site disposal of soil/fill from Grid Sections C through H, Clean Earth of Carteret requested the collection and laboratory analysis of four additional waste characterization soil samples to obtain disposal approval of the remaining soil/fill from Grid Sections A and B. On August 29, 2018, several test pits were excavated within the on-Site and off-Site portion of the northern end of the shoreline that required excavation to construct the shoreline bulkhead along the west side of the Site. From the test pits, EBC formed two 5-point composite waste characterization soil samples representing the soil/fill that required removal. In addition, EBC retained two worst case grab soil samples for laboratory analysis of VOCs. The 5-point composite waste characterization soil samples were collected in laboratory provided glassware and submitted to Phoenix Environmental Laboratories, Inc. for laboratory analysis of SVOCs, pesticides, herbicides, PCBs, TCLP metals, RCRA metals, EPH, and RCRA characteristics.

Disposal Facility Approvals

Based on the laboratory results of the waste characterization soil samples, Clean Earth of Carteret and Bayshore Soil Management, LLC approved soil/fill to be excavated for the shoreline bulkhead. A copy of the formal soil disposal request letter prepared by EBC, and a copy of the formal soil disposal acceptance letters prepared by CEC and Bayshore Soil Management, LLC are included in Appendix K and Appendix M.

4.3.1.8 Waste Characterization Summary

A summary of the waste characterization soil sampling performed at the Site is provided as Table 3. A copy of each of the laboratory reports for the lead delineation sampling and waste characterization soil sampling are attached to the soil disposal request letters prepared for each disposal facility (Appendix J, Appendix K, Appendix L, Appendix M) and the results are summarized and compared to Unrestricted Use SCOs, Restricted Residential Use SCOs, and EPA TCLP Regulatory Levels on Tables 16 and 17.

4.3.2 Excavation and Disposal of Lead Hot Spot

Excavation of the D008 Hazardous Lead soil from the lead hotspot within the raised terminal platform building was performed on July 10, 2017, and July 11, 2017. All D008 Hazardous Lead

soil/fill excavation and truck loading was performed by the excavation contractor using a track mounted excavator. The D008 Hazardous Lead soil/fill was loaded into 10-wheel dump trucks provided by Clean Earth and transported as D008 Hazardous Lead soil to Clean Earth of North Jersey.

4.3.2.1 Disposal Details – Lead Hot Spot – D008 Hazardous Waste

A total of 542.87 tons of D008 Hazardous Lead soil was excavated from the lead hotspot areas and loaded into NYSDEC Part 364 Waste Transporter Permitted 10-wheel dump trucks dispatched by Clean Earth to Clean Earth of North Jersey. Clean Earth of North Jersey is located at 115 Jacobus Avenue, Kearny, NJ 07032. The facility is a RCRA Part B permitted transfer, storage and disposal facility (TSDF) that accepts hazardous and industrial waste under New Jersey Permit No. NJD991291105. Hazardous disposal manifests and associated scale tickets for each truck load are provided as a digital file in Appendix J. A summary of the waste streams and their destination is provided in Table 2.

4.3.3 Removal of Construction and Demolition Debris

Prior to remedial activities, the Site consisted of a cap consisting of asphalt and/or concrete that covered most of the lot. The concrete and asphalt was removed where excavation of underlying soil was required (hotspots, Building B, and Building C, areas to be capped with 2 ft of clean soil), and where installation of soil surcharge was required. Concrete footings, walls, and foundations encountered during excavation were segregated from the soil/fill and stockpiled. The scraped up asphalt and pieces of concrete were loaded into 10-wheel dump trucks using a track mounted excavator, and transported as construction and demolition debris to either P Park NJ, LLC located in Prospect, New Jersey, or Faztec Industries located in Staten Island, New York.

4.3.3.1 Disposal Details – Faztec

In March and April of 2017, the former raised terminal platform building was demolished and the concrete was broken into pieces for off-Site disposal. From March 20, 2017, to April 4, 2017, a total of 101 truckloads of concrete was transported to Faztec Industries located at 200-220 Bloomfield Avenue in Staten Island, New York 10314. Faztec Industries is a NYSDEC Active Registered Construction and Demolition Debris Processing Facility (360 Permit Number 43W047) permitted to accept uncontaminated concrete, brick and soil. A copy of a print out from

the NYSDEC website of permitted construction and demolition debris processing facilities listing Faztech Industries as Active/Registered is included in Appendix N. The asphalt and concrete was transported by Castomarc Express LLC. A truck ticket for each of the loads of concrete is attached in Appendix N.

On June 10, 2019, EBC forwarded a formal disposal request letter to Faztec Industries requesting approval to transport asphalt and underlying 1" stone from the Site to the Faztec Industries facility. A copy of the request letter is included in Appendix N. From April 4, 2017, to September 12, 2019, a total of 145 truckloads of asphalt and/or concrete were transported to Faztec Industries located at 200-220 Bloomfield Avenue in Staten Island, New York 10314. Faztec Industries is a NYSDEC Active Registered Construction and Demolition Debris Processing Facility (360 Permit Number 43W047) permitted to accept uncontaminated concrete, brick and soil. A copy of a print out from the NYSDEC website of permitted construction and demolition debris processing facilities listing Faztech Industries as Active/Registered is included in Appendix N. The asphalt and concrete was transported by Castomarc Express LLC. A truck ticket for each of the loads of concrete is attached in Appendix N.

4.3.3.2 Disposal Details – PPark, NJ LLC

On June 10, 2019, EBC forwarded a formal disposal request letter to P Park NJ, LLC requesting approval to transport pieces of concrete from the Site to the P Park NJ, LLC facility. P Park NJ, LLC issued a formal approval letter on June 11, 2019. A copy of the request letter and approval letter is included in Appendix N. From August 26, 2019, to August 12, 2019, a total of 15 truckloads of concrete were transported to P Park NJ, LLC located at 100 Plantan Avenue in Prospect Park, New Jersey, 07508. P Park NJ, LLC is a New Jersey Department of Environmental Protection licensed Class B Facility permitted for the acceptance and processing of concrete, brick, and block for recycling. A copy of a print out from the NYSDEC website of permitted construction and demolition debris processing facilities listing Faztech Industries as Active/Registered is included in Appendix N. The asphalt and concrete was transported by Castomarc Express LLC. A truck ticket for each of the loads of concrete is attached in Appendix N.

4.3.4 Excavation and Disposal of Non-Hazardous Contaminated Soil/Fill

Historic fill material and petroleum contaminated soil that required excavation and off-Site disposal was removed from the Site in accordance with the procedures outlined under the approved Remedial Action Work Plan. In accordance with the approved RAWP, a truck wash was installed to allow for trucks to enter and exit from West Street. Two laborers inspected each truck before it exited, and used a power washer and/or hose to remove any remaining soil stuck to the wheels and undercarriage of each truck. In addition, the laborers periodically swept the street and the site ingress/egress. All soil/fill excavation and truck loading was performed by the excavation contractor (Empire Construction) using one or more track mounted excavators.

4.3.4.1 Former Fueling Area Hotspot

An excavator was used to scrape up and stockpile the asphalt and concrete covering the area of the former Fueling Area Hotspot beginning on September 12, 2017. Installation of the 2 inch diameter dewatering wells around the perimeter and through the center of the former Fueling Area Hotspot began on September 18, 2017. Excavation of the Former Fueling Area Hotspot was performed in November and December 2017. All soil/fill excavated from the Former Fueling Area Hotspot was loaded into 10-wheel dump trucks for transport to Clean Earth of Carteret from October 26, 2017, to December 12, 2017.

Following excavation of the 70 ft by 200 ft hotspot to a depth of approximately 10 feet, endpoint soil samples were collected from the base and sidewalls of the excavation. The laboratory results of the endpoint soil samples collected from the base and sidewalls indicated remaining soil met Protection of Groundwater SCOs. Following DEC approval to backfill each completed section, a demarcation barrier was installed, and each section was backfilled with clean native soil meeting Unrestricted Use SCOs and Protection of Groundwater SCOs. However, Grid Sections FA3 and FA4 were backfilled with on-Site soil that met Restricted Residential SCOs and Protection of Groundwater SCOs. The soil/fill used to backfill the two grid sections originated from Grid Sections FA1, FA2, and FA5 from 0 to 5 feet below grade. Reuse is described below in section 4.3.6. The excavation elevation and area of the Former Fueling Area Hotspot is shown on the on the excavation survey (Figure 3).

4.3.4.2 SVOC Hotspots

The RAWP identified six SVOC hotspot areas with elevated concentrations of SVOCs related to fill materials in the vicinity of soil borings B4, B6, B17, B19, B32 and B34. Excavation of each hotspot is described below:

SVOC Hotspot 1 (B17)

A 10ft by 10ft wide excavation to a depth of 3 ft was excavated at the location of soil boring B17 (identified as SVOC Hotspot 1). Based on endpoint and delineation soil sample results, the excavation was expanded to the east (19ft from the B17 boring location), north and south (10ft from the B17 boring location), and west (12ft from the B17 boring location). The location of the SVOC Hotspot 1 excavation is shown on Figure 3.

SVOC Hotspot 2 (B19)

A 10ft by 10ft wide excavation to a depth of 3 ft was excavated at the location of soil boring B19 (identified as SVOC Hotspot 2). The location of the SVOC Hotspot 2 excavation is shown on Figure 3.

SVOC Hotspot 3 (B6)

Following removal of the raised terminal platform building and underlying fill, additional excavation of a 10ft by 10ft wide area to a depth of 3 ft was performed at the location of soil boring B6 (identified as SVOC Hotspot 3). Based on endpoint soil sample results, the resulting excavation was 11 ft by 11 ft and 4 ft deep. The location of the SVOC Hotspot 3 excavation is shown on Figure 3.

SVOC Hotspot 4 (B32)

Following removal of the loading bay building slab and underlying fill, additional excavation of a 10ft by 10ft wide area to a depth of 3 ft was performed at the location of soil boring B32 (identified as SVOC Hotspot 4). Based on endpoint soil sample results, the north sidewall of the excavation was expanded 1 ft to the north. The location of the SVOC Hotspot 4 excavation is shown on Figure 3.

SVOC Hotspot 5 (B34)

Following removal of the loading bay building slab and underlying fill, additional excavation of a 10ft by 10ft wide area to a depth of 3 ft was performed at the location of soil boring B34 (identified as SVOC Hotspot 5). The location of the SVOC Hotspot 1 excavation is shown on Figure 3.

SVOC Hotspot 6 (B4)

A 10ft by 10ft wide excavation to a depth of 3 ft was excavated at the location of soil boring B4 (identified as SVOC Hotspot 6). Based on endpoint soil sample results, the west and south sidewalls of the excavation were expanded 1 ft in both directions, and the east sidewall was expanded 2 ft to the east. In addition, the entire excavation was performed to a depth of 4 t. The location of the SVOC Hotspot 4 excavation is shown on Figure 3.

Soil/fill excavated from each of the SVOC hotspots was loaded into 10-wheel dump trucks for transport to Clean Earth of Carteret. The excavation elevation and area of each of the six SVOC hotspots is depicted on the excavation survey (Figure 3).

4.3.4.3 Stormwater Sewer Connection Trench Excavation

In order to install a stormwater sewer connection, a 5ft wide trench was excavated within several portions of the Site. In areas where the trench was excavated with the soil surcharage area, the clean native soil was stockpiled for later reuse, and soil below the demarcation barrier was stockpiled on/under plastic sheeting to await waste characterization soil sampling to allow for off-Site disposal. If the trench was performed outside of the surcharge area, all soil/fill excavated for the trench was stockpiled with the other soil/fill. The locations/depths where the trench excavation was performed is shown on the excavation survey (Figure 3).

Soil/fill from the two stockpiles generated by excavating the trenches was loaded into 10-wheel dump trucks for transport to Clean Earth of Bethlehem from August 26, 2019, to September 10, 2019.

4.3.4.4 Building C Cellar Excavation

The 100 ft by 60 ft cellar area of Building C was excavated to a depth of approximately 12 feet below grade. Additional deeper excavation was performed as necessary for footings, pile caps,

and elevator pits. The excavation location/depths for the cellar for Building C is shown on the excavation survey (Figure 3).

Soil/fill from the Red Grid Section from the interval 0 to 2 feet below grade was loaded into 10-wheel dump trucks for transport to Bayshore Soil Management, LLC from July 23, 2019, to July 30, 2019. Soil/fill excavated from all of the other grid sections and depths was loaded into 10-wheel dump trucks for transport to Clean Earth of Bethlehem from July 9, 2019, to September 10, 2019.

4.3.4.5 Excavation Required to Install 2ft Clean Soil Cap

C4/D4 Boundary

On August 18, 2019, an approximate 80 ft by 80 ft area was excavated at the boundary of the C4/D4 grid sections to the southern property line to allow for installation of a cap consisting of a demarcation barrier and 2 feet of clean soil. The daily status report and labeling for the sample incorrectly identify the area as Grid Section D3. Soil/fill excavated from the 0 to 2 ft interval was stockpiled in one stockpile, and the soil excavated from the 2 to 3 ft interval was stockpiled as a second stockpile. Excavation at the boundary of the C4/D4 grid sections is depicted on the excavation survey (Figure 3).

E2/West Street Boundary

On August 20, 2019, an approximate 65 ft by 90 ft area was excavated to a depth ranging from approximately 2ft at the West Street property line to approximately 0.5 feet on the western end of the excavation. The excavation was performed within the E2 grid section to allow for installation of a cap consisting of a demarcation barrier and 2 feet of clean soil. Soil/fill excavated the area was stockpiled. All soil/fill from the E2 0 to 2ft stockpile and soil/fill from the C4/D4 0 to 2ft soil stockpiles were loaded into 10-wheel dump trucks for transport to Clean Earth of Carteret on June 22, 2018, and June 25, 2018. All soil/fill from the E2 2 to 3ft stockpile was loaded into 10-wheel dump trucks for transport to Bayshore Soil Management, LLC on June 22, 2018, and June 25, 2018. Excavation/removal of the top 0.5ft to 2 ft of soil/fill within the E2 grid section is depicted on the excavation survey (Figure 3).

B4

On July 5, 2018, the top 1 to 2 feet of soil/fill was excavated from two adjacent areas within the B4 grid section to allow for installation of a cap consisting of a demarcation barrier and 2 feet of clean soil. A stockpile estimated to be approximately 400 cubic yards was generated. All soil/fill from the B4 0 to 2ft stockpile was loaded into 10-wheel dump trucks for transport to Clean Earth of Carteret from August 1, 2018, to August 8, 2018. Excavation/removal of the top 1 to 2 feet of soil/fill within the B4 grid section up is depicted on the excavation survey (Figure 3).

4.3.4.6 Excavation of Former Raised Terminal Platform Building (Loading Dock)

The former raised terminal platform was raised approximately 3 to 4 feet above the rest of the Site. Following removal of the concrete slab covering the platform, soil/fill was encountered. Excavation of the soil/fill contained within the concrete forms of the former raised terminal platform building area began on March 20, 2017. Excavation began on the east side of the former raised terminal platform and continued west. All soil/fill was removed to a depth of approximately 0.5 to 1 ft below the finished grade around the platform. Soil/fill contained within the platform within Grid Sections C through H was live loaded into 10-wheel dump trucks for transport to Clean Earth of Carteret. Additional waste characterization soil samples were requested from Clean Earth of Carteret from Grid Sections A and B to satisfy the facility sampling frequency requirement. Due a TCLP lead concentration greater than 5.0 mg/L within one of the additional waste characterization soil samples, a portion of the A and B grid sections required handing/disposal as D008 Hazardous Lead soil/fill. The D008 Hazardous Lead soil/fill was live loaded into 10-wheel dump trucks for transport to Clean Earth of North Jersey on July 10, 2017, and July 11, 2017. The soil/fill excavated from the areas delineated as non-hazardous soil/fill within grid sections A and B was live loaded into 10-wheel dump trucks for transport to Bayshore Soil Management, LLC on May 10, 2017. The area of the former platform is shown on the excavation diagram (Figure 3). Following excavation of the three SVOC hotspots within the same former raised terminal platform building area, the SVOC hotspots and platform area was backfilled with clean native soil. A 2 to 4 inch layer of ¾" bluestone from NY Sand & Stone was installed, and then the area of the platform was capped with a new 2 inch minimum layer of asphalt. The area of the raised terminal platform is depicted on the on the excavation survey (Figure 3).

4.3.4.7 Shoreline Bulkhead

Excavation of shoreline area began on August 21, 2018, and consisted of the removal of soil/fill and concrete and rocks to a depth of approximately 8 feet below grade. From October 10, 2018, to March 4, 2019, soil/fill excavated from the shoreline area was loaded into 10-wheel dump trucks for transport to Clean Earth of Carteret. From September 7, 2018, to January 31, 2019, soil/fill excavated from the shoreline area was loaded into 10-wheel dump trucks for transport to Bayshore Soil Management, LLC. Metal pilings were installed along the shorefront, and a concrete bulkhead/pier was constructed along the property line. Virgin mined stone was imported to backfill both the on-Site and off-Site areas in front and behind of the bulkhead/pier, and the on-Site area has been capped with asphalt. The excavation location/depths for installation of the concrete bulkhead/pier is shown on the excavation survey (Figure 3).

4.3.4.8 Disposal Details – Non-Hazardous Contaminated Soil/Fill

A total of 44,809.80 tons of historic fill/soil petroleum contaminated soil was excavated from the Former Fueling Area Hotspot, the six SVOC hotspots, the raised terminal platform building area, trench for the stormwater sewer connection, cellar of Building C, and areas that required excavation to install a 2ft clean soil layer, and loaded into NYSDEC Part 364 Waste Transporter Permitted 10-wheel dump trucks dispatched by Clean Earth as non-hazardous waste at either Clean Earth of Carteret, Clean Earth of Bethlehem, or Bayshore Soil Management, LLC. Formal soil disposal request letters, soil disposal acceptance letters, facility permits, and non-hazardous manifests for each facility are included in Appendix K (CEC), Appendix L (CEB), Appendix M (Bayshore). A summary of the waste streams and their destination is provided in Table 2.

4.3.5 Underground Storage Tank Removal

A total of three underground storage tanks were encountered at the Site during excavation. Each of the tanks was removed from the ground by the excavation contractor and cut and cleaned by ABC Tank Repair & Lining, Inc. (ABC). A description of each is provided below.

4.3.5.1 5,000-gallon No. 2 Fuel Oil Underground Storage Tank

On July 11, 2017, one 5,000-gallon No. 2 fuel oil underground storage tank (Noted as Tank No. HO-1 on the PBS Database) was encountered near West Street in the location of the former loading bay building. The location of the tank is shown on Figure 3. The tank was found to have

been previously abandoned in place with concrete (half filled). On July 12, 2017, the steel tank was cut into numerous small pieces and the concrete contained within the tank was broken into pieces small enough to load into a truck using an excavator mounted demolition hammer. The steel tank pieces were transported to a local metal recycling facility for proper off-Site disposal.

The excavation contractor excavated two test pits within the base of the tank excavation to a depth of 3 feet below the bottom of the tanks. EBC field screened soil recovered from the tank excavation. No stained soil, or olfactory evidence of a spill/leak was observed and no photo-ionization detector readings above background concentrations were reported.

EBC collected five endpoint verification soil samples from the tank grave. The endpoint soil samples consisted of one bottom soil samples (UST 1B), and four sidewall soil samples collected from the base of the excavation (UST1W, UST1E, UST1N, UST1S). The tank endpoint soil samples were collected in laboratory supplied containers, transferred to a cooler with ice and transported under chain-of-custody protocol to Phoenix Environmental Laboratories, Inc. (Phoenix) in Manchester, Connecticut. The soil samples were analyzed for volatile organic compounds (VOCs) via EPA Method 8260 (CP51 List) and semi-volatile organic compounds (SVOCs) via EPA Method 8270 (CP51 List). A copy of the laboratory report is included in Appendix I. The results are summarized and compared to NYSDEC Part 375.6 Unrestricted Use SCOs and Restricted Residential Use SCOs in Tables 21 and 22. No VOCs or SVOCs were detected above Protection of Groundwater or Unrestricted Use SCOs within the endpoint soil samples with the exception of Acetone, a common laboratory contaminant. All acetone detections were below Residential SCOs.

In accordance with New York City regulations, a tank removal affidavit was filed with the NYFD. A copy of the NYCFD tank removal affidavit filed for the 5,000-gallon underground storage tank is attached in Appendix I. A NYSDEC PBS Application was submitted to the NYSDEC to register/deregister the 5,000-gallon No. 2 fuel oil underground storage tank. A printout copy of the NYSDEC PBS online database, which lists the Tank No. HO-1 as closed/removed is attached in Appendix I.

4.3.5.2 Two 550-gallon Gasoline Underground Storage Tanks

On July 23, 2019, two 550-gallon gasoline underground storage tanks (Noted as Tank No. 2 and Tank No. 3 on the PBS Database) were exposed while excavating for the cellar for Building C. The tanks were installed immediately next to each other and were encased in concrete. The tanks were located approximately 6 feet from the Kent Avenue property line, and approximately 54 feet from the north (Oak Street) property line. The location of the tanks is shown on Figure 3. The tanks were found to have been previously abandoned in place with water. The water contained within the tanks was removed on August 13, 2019, by ABC. The tanks were then removed from the ground and set on asphalt to be cut and cleaned by ABC. EBC inspected the exterior and interior of the steel tanks for corrosion and evidence of holes/penetrations. No holes/penetrations were observed and no evidence of a spill/leak was observed.

The excavation contractor excavated two test pits within the tank excavation to a depth of 3 feet below the bottom of the tanks. EBC field screened soil recovered from the tank excavation. No stained soil, or olfactory evidence of a spill/leak was observed and no photo-ionization detector readings above background concentrations were reported.

EBC collected six endpoint verification soil samples from the tank excavation. The endpoint soil samples consisted of two bottom soil samples (Tank EP B1 and Tank EP B2), and four sidewall soil samples collected from the base of the excavation (Tank EP E, Tank EP W, Tank EP N, Tank EP S). The tank endpoint soil samples were collected in laboratory supplied containers, transferred to a cooler with ice and transported under chain-of-custody protocol to Phoenix Environmental Laboratories, Inc. (Phoenix) in Manchester, Connecticut. The soil samples were analyzed for volatile organic compounds (VOCs) via EPA Method 8260 and semi-volatile organic compounds (SVOCs) via EPA Method 8270. A copy of the laboratory report is included in Appendix I. The results are summarized and compared to NYSDEC Part 375.6 Unrestricted Use SCOs and Restricted Residential Use SCOs in Tables 22 and 22. No VOCs or SVOCs were detected above Protection of Groundwater or Unrestricted Use SCOs within the endpoint soil samples.

The steel tanks were transported to a local metal recycling facility for proper off-Site disposal. In accordance with New York City regulations, a tank removal affidavit was filed with the NYFD.

A copy of the NYCFD tank removal affidavit filed for the two 550-gallon underground storage tanks is attached in Appendix I. A NYSDEC PBS Application was submitted to the NYSDEC to register/deregister the two 550-gallon gasoline oil underground storage tanks. A printout copy of the NYSDEC PBS online database, which lists Tank No. 2 and Tank No. 3 as closed/removed is attached in Appendix I.

4.3.5.3 Disposal Details

A total of 1,200 gallons of petroleum contaminated water was removed by ABC on August 13, 2019, and transported to New York Oil Recovery located at 94 Hausman Street, Brooklyn, New York 11222. A copy of the non-hazardous manifest for the petroleum contaminated water is included in Appendix I.

4.3.6 On-Site Reuse of Soil/Fill Meeting POG and RRSCOs in Former Fueling Area

The waste characterization soil sampling event performed within the Former Fueling Area Hotspot (see Section 4.3.1.2) did not identify any SVOCs, pesticides or PCBs above Restricted Residential SCOs or Protection of Groundwater SCOs within Grid Sections FA1, FA2, or FA5 within the depth interval 0 to 5 feet below grade. In addition, no VOCs were detected above Restricted Residential SCOs or Protection of Groundwater SCOs. EBC collected an additional 12 grab soil samples for laboratory analysis of VOCs on October 26, 2017, to achieve the sampling/analysis frequency outlined by Table 5.4(e)10 of DER-10 to determine suitability for on-Site reuse as backfill. The 12 grab soil samples were collected in laboratory provided glassware and submitted to Phoenix Environmental Laboratories, Inc. for laboratory analysis of VOCs. Based on the results of the three 5-point composite soil samples collected on January 19, 2017, and the additional grab soil samples collected on October 26, 2017, the soil was suitable for on-Site reuse.

On October 31, 2017, AMC emailed a request to reuse 1,300 cubic yards of overburden soil excavated from the Former Fueling Area Hotspot from Grid Sections FA1, FA2, and FA5 from 0 to 5 feet below grade.

The request included the test pit sampling plan and laboratory results of three 5-point composite soil samples and 15 grab soil samples. An email from NYSDEC (dated November 6, 2017)

approved the request to reuse 1,300 cubic yards of soil from Grid Sections FA1, FA2, and FA5 from 0 to 5 feet below grade. A copy of the email request and NYSDEC approval email is included in Appendix Q.

On December 7, 2017, and December 8, 2017, the soil stockpile of soil excavated from Grid Sections FA1, FA2, and FA5 from 0 to 5 feet below grade, was used as backfill above the demarcation barrier within the FA3 and FA4 grid sections.

4.3.7 Excavation Dewatering

With groundwater present at approximately 9 to 10 feet below the surface, dewatering was required to facilitate excavation below this depth for the Former Fueling Area Hotspot and the cellar level of Building C. Dewatering was accomplished by pumping groundwater from 1.5 inch diameter PVC, deep well points installed around the perimeter and across the center of the Former Fueling Area Hotspot, and around the perimeter of the Building C foundation.

4.3.7.1 Disposal Details

A sewer discharge permit was filed with the New York City Department of Environmental Protection (NYCDEP) in July 2014, to allow the discharge of up to 576,000 gallons per day through an existing 6 inch diameter connection to the 92 inch by 68 inch combined sewer overflow located in Quay Street between West Street and East River. The permit was approved by the NYCDEP on February 28, 2018. A Long Island Well Permit Application dated July 6, 2014, was filed with the NYSDEC, and a Long Island Well Permit Equivalent was issued by the NYSDEC on March 9, 2018. The Long Island Well Permit Equivalent approved a maximum daily pumpage of 576,000 gallons per day.

Dewatering operations consisted of pumping groundwater and surface water into a 18,000 gallon settling tank to remove fine suspended materials through settling, a filter unit fitted with 1-micron filter bages to remove suspended solids, and two 8,000 lb carbon units installed in series to remove volatile organic compounds.

Dewatering for the former Fueling Area Hotspot began on October 29, 2017, and continued January 11, 2018. Approximately 1,569,600 gallons of water were treated and discharged to the sewer system from October 29, 2017, to January 11, 2018 (approximately 21,210 gpd).

Dewatering for the cellar for Building C began on August 6, 2019, and will continue to operate through December 2019. Approximately 1,560,900 gallons of water were treated and discharged to the sewer system from August 6, 2019, to September 27, 2019 (approximately 29,450 gpd).

A copy of the NYCDEP sewer discharge permit, Long Island Well Permit and treatment system design specifications are provided in Appendix U.

4.3.8 Disposal Summary

The table provided below shows the total quantities of each category of material removed from the Site and the disposal location.

Table 2. Off-Site Disposal Summary

Disposal Facility	Asphalt Concrete (yd^3)	Concrete (yd^3)	D008 Hazardous Lead Soil (Tons)	Historic Fill and Petroleum Contaminated Material (Tons)
P Park NJ, LLC 100 Planten Avenue Prospect Park, New Jersey 07508	-	280	-	-

4.4 REMEDIAL PERFORMANCE/DOCUMENTATION SAMPLING

4.4.1 Former Fueling Area Hotspot Endpoint Soil Sampling

The RAWP specified the collection and laboratory analysis of endpoint samples at a rate of one endpoint soil sample per 900 ft^2 from the base of the excavation, and one endpoint verification soil sample from the sidewalls of the excavation at a rate of one endpoint verification soil sample per 30 linear feet to verify that remedial goals had been achieved. Therefore, the area designated as the Former Fueling Area Hotspot Site was divided into 12 separate 900 ft^2 Grid Sections, and

one endpoint verification soil sample was collected from the base of each of the 12 Grid Sections to verify that remedial goals had been achieved (sample IDs Bottom 1 through Bottom 12). In addition, a total of 16 sidewall endpoint verification soil samples were collected from the sidewalls of the Former Fueling Area Hotspot excavation (sample IDs SW1 through SW16). The collection location of each of the endpoint verification soil samples is shown on Figure 4.

Each of the endpoint soil samples were submitted to Phoenix for laboratory for analysis of TCL VOCs and SVOCs according to EPA Methods 8260 and 8270 with Category B Deliverables. No VOCs were detected above Protection of Groundwater SCOs or Track 1 Unrestricted Use SCOs. No SVOCs were detected above Protection of Groundwater SCOs. The SVOC indeno(1,2,3-cd)pyrene was detected above Restricted Residential SCOs within sidewall soil samples SW8 (520 µg/kg) and SW15 (510 µg/kg). The results of the 12 bottom and 16 sidewall endpoint verification endpoint soil samples collected from the Former Fueling Area Hotspot excavation confirms that Former Fueling Area Hotspot has been removed.

A copy of each of the laboratory reports for the bottom and sidewall endpoint verification soil samples collected from the Former Fueling Area Hotspot is attached in Appendix R2. The results are summarized and compared to NYSDEC Part 375.6 Unrestricted Use SCOs, Restricted Residential Use SCOs, and Protection of Groundwater SCOs in Tables 23 through 26. Data Usability Summary Reports (DUSRs) were prepared for all data generated in this remedial performance evaluation program. DUSRs are included in Appendix T.

4.4.2 SVOC Hotspots 1-6 Endpoint Soil Sampling

The RAWP identified six SVOC hotspot areas with elevated concentrations of SVOCs related to fill materials in the vicinity of soil borings B4, B6, B17, B19, B32 and B34. The RAWP specified the collection and laboratory analysis of one bottom sample per 900 ft^2 of bottom area, and one sidewall sample per 30 linear feet following excavation to verify that remedial goals had been achieved. The collection and laboratory analysis of the endpoint soil samples collected from each of the six SVOC hotspots is described below.

4.4.2.1 SVOC Hotspot 1 (B17)

An 10ft by 10ft wide excavation to a depth of 3 ft was excavated at the location of soil boring

B17 (identified as SVOC Hotspot 1). On November 2, 2017, EBC collected on endpoint soil sample from the base of the excavation (sample ID HS Bottom) and one endpoint soil sample from a depth of approximately 2ft from each of the four the sidewalls of the excavation (sample IDs HS1 E, HS1 W, HS1 S, and HS1 N). The collection location of each of the endpoint soil samples is shown on Figure 4. Each of the endpoint soil samples were submitted to Phoenix for laboratory for analysis of TCL SVOCs by EPA Method 8270 with Category B Deliverables. No SVOCs were detected above Protection of Groundwater SCOs within the endpoint soil sample collected from the base of the SVOC Hotspot 1 excavation. However, several SVOCs were detected above Protection of Groundwater SCOs within each of the four sidewall endpoint soil samples. On November 8, 2017, EBC collected soil samples outward in 1 ft intervals from each of the sidewall samples (representing 11, 12, and 13 ft from the B17 boring location) at a depth of approximately 2 ft to delineate the horizontal extent of SVOC Hotspot 1. The samples representing the next 1 ft interval outward (11 ft from the B17 boring location) were submitted for laboratory analysis of SVOCs via EPA Method 8270 with Category B Deliverables. No SVOCs were detected above Protection of Groundwater SCOs within the endpoint soil sample collected to the north (sample ID HS1N@11ft) and south (sample ID HS1S@11ft). SVOCs were detected above Protection of Groundwater SCOs within the 11ft sample collected to the west (sample ID HS1W@11ft). Therefore, the sample collected from the next 1ft interval to the west (sample ID HS1 at 12ft) was submitted for laboratory analysis of SVOCs via EPA Method 8270 with Category B Deliverables. No SVOCs were detected above Protection of Groundwater SCOs within the sample collected 2ft west of the SVOC Hotspot 1 excavation. All three 1ft interval soil samples collected to the east reported SVOCs above Protection of Groundwater SCOs. Therefore, on November 16, 2017, EBC collected soil samples outward in 1 ft intervals from the east sidewall (representing 14, 15, and 16 ft from the B17 boring location) at a depth of approximately 2 ft to delineate the horizontal extent of SVOC Hotspot 1 to the east. All three soil samples (sample IDs HS1@14ft, HS1@15ft, and HS1@16ft) were submitted for laboratory analysis of SVOCs via EPA Method 8270 with Category B Deliverables, and all three soil samples reported SVOCs at concentrations above Protection of Groundwater SCOs. Therefore, on November 22, 2017, EBC collected soil samples outward in 1 ft intervals from the east sidewall (representing 17, 18, and 19 ft from the B17 boring location) at a depth of approximately 2 ft to delineate the horizontal extent of SVOC Hotspot 1 to the east. The soil

samples collected from 17 and 18ft to the east from the B17 boring location (sample IDs HS1 E at 17ft, and HS1 E at 18ft) were both submitted for laboratory analysis for SVOCs, and SVOCs were detected above Protection of Groundwater SCOs within both samples. The soil sample representing 19ft to the east from the B17 boring location (sample ID HS1 E at 19ft) was then submitted for laboratory analysis of SVOCs via EPA Method 8270 with Category B Deliverables, and no SVOCs were detected above Protection of Groundwater SCOs within the sample. Based on these results, the boundaries of SVOC Hotspot 1 was defined to the east (19ft from the B17 boring location), north and south (10ft from the B17 boring location), and west (12ft from the B17 boring location).

On December 5, 2017, a machine (payloader) leaking diesel onto the asphalt was observed immediately adjacent to the northwest corner of the SVOC Hotspot 1 excavation. A 5ft by 5ft wide excavation to a depth of approximately 3 feet below grade was created to remove any potentially diesel impacted soil below the asphalt. Because the excavation connected with the SVOC Hotspot 1 excavation to the east, no sidewall soil sample to the east could be collected. However, on December 6, 2017, EBC collected one endpoint soil sample from the base of the diesel spill excavation (sample ID HS1 Bottom Corner), and endpoint soil samples from the north sidewall (sample ID HS1N Corner), west sidewall (sample ID HS1W Corner), and south sidewall (sample ID HS1S Corner). Each of the four endpoint soil samples was submitted for laboratory analysis of SVOCs via EPA Method 8270 with Category B Deliverables. No SVOCs were detected above Protection of Groundwater SCOs within the endpoint soil sample collected from the base of the diesel spill excavation (sample ID HS1 Bottom Corner), or the endpoint soil samples collected from the north sidewall (sample ID HS1N Corner), and south sidewall (sample ID HS1S Corner). However, SVOCs were detected above Protection of Groundwater SCOs within the endpoint soil sample collected from the west sidewall (sample ID HS1W Corner). On December 11, 2017, EBC collected a soil sample 1 ft farther west at a depth of approximately 2 ft to delineate the horizontal extent of SVOC Hotspot 1. The sample was submitted for laboratory analysis of SVOCs via EPA Method 8270 with Category B Deliverables. No SVOCs were detected above Protection of Groundwater SCOs within the sample collected 1 ft farther to the west.

A copy of each of the laboratory reports for the bottom and sidewall endpoint verification soil samples collected from the SVOC Hotspot 1 is attached in Appendix R1. The results are summarized and compared to NYSDEC Part 375.6 Unrestricted Use SCOs, Restricted Residential Use SCOs, and Protection of Groundwater SCOs in Tables 23 through 26. Data Usability Summary Reports (DUSRs) were prepared for all data generated in this remedial performance evaluation program. DUSRs are included in Appendix T.

4.4.2.2 SVOC Hotspot 2 (B19)

An 10ft by 10ft wide excavation to a depth of 3 ft was excavated at the location of soil boring B19 (identified as SVOC Hotspot 2). On December 6, 2017, EBC collected on endpoint soil sample from the base of the excavation (sample ID HS2 Bottom) and one endpoint soil sample from a depth of approximately 2ft from each of the four the sidewalls of the excavation (sample IDs HS2 N, HS2 E, HS2 W, and HS2 S). The collection location of each of the endpoint soil samples is shown on Figure 4. Each of the endpoint soil samples were submitted to Phoenix for laboratory for analysis of TCL SVOCs by EPA Method 8270 with Category B Deliverables. No SVOCs were detected above Protection of Groundwater SCOs within the bottom endpoint soil sample or the four endpoint sidewall samples.

A copy of the laboratory report(s) for the bottom and sidewall endpoint verification soil samples collected from the SVOC Hotspot 2 is attached in Appendix R1. The results are summarized and compared to NYSDEC Part 375.6 Unrestricted Use SCOs, Restricted Residential Use SCOs, and Protection of Groundwater SCOs in Tables 23 through 26. Data Usability Summary Reports (DUSRs) were prepared for all data generated in this remedial performance evaluation program. DUSRs are included in Appendix T.

4.4.2.3 SVOC Hotspot 3 (B6)

Following removal of the loading bay building slab and underlying fill, additional excavation of a 10ft by 10ft wide area to a depth of 3 ft was performed at the location of soil boring B6 (identified as SVOC Hotspot 3). On March 30, 2017, EBC collected on endpoint soil sample from the base of the excavation (sample ID EP3-5) and one endpoint soil sample from a depth of approximately 2ft from each of the four the sidewalls of the excavation (sample IDs EP3-1, EP3-2, EP3-3, and EP3-4). The collection location of each of the endpoint soil samples is shown on

Figure 4. Each of the endpoint soil samples were submitted to Phoenix for laboratory for analysis of TCL SVOCs by EPA Method 8270 with Category B Deliverables. SVOCs were detected above Protection of Groundwater SCOs within the bottom endpoint soil sample and all four endpoint sidewall samples.

On April 24, 2017, EBC collected an additional bottom endpoint soil sample (sample ID EP3-5A) and four additional sidewall endpoint soil samples (sample IDs EP3-1A, EP3-2A, EP3-3A, and EP3-4A) following additional excavation of SVOC Hotspot to expand the excavation 1 ft deeper and 1 ft larger in each direction. Each of the endpoint soil samples were submitted to Phoenix for laboratory for analysis of TCL SVOCs by EPA Method 8270 with Category B Deliverables. No SVOCs were detected above Protection of Groundwater SCOs within the bottom endpoint soil sample or the four endpoint sidewall samples.

A copy of the laboratory report(s) for the bottom and sidewall endpoint verification soil samples collected from the SVOC Hotspot 3 is attached in Appendix R1. The results are summarized and compared to NYSDEC Part 375.6 Unrestricted Use SCOs, Restricted Residential Use SCOs, and Protection of Groundwater SCOs in Tables 23 through 26. Data Usability Summary Reports (DUSRs) were prepared for all data generated in this remedial performance evaluation program. DUSRs are included in Appendix T.

4.4.2.4 SVOC Hotspot 4 (B32)

Following removal of the loading bay building slab and underlying fill, additional excavation of a 10ft by 10ft wide area to a depth of 3 ft was performed at the location of soil boring B32 (identified as SVOC Hotspot 4). On March 30, 2017, EBC collected on endpoint soil sample from the base of the excavation (sample ID EP4-5) and one endpoint soil sample from a depth of approximately 2ft from each of the four the sidewalls of the excavation (sample IDs EP4-1, EP4-2, EP4-3, and EP4-4). The collection location of each of the endpoint soil samples is shown on Figure 4. Each of the endpoint soil samples were submitted to Phoenix for laboratory for analysis of TCL SVOCs by EPA Method 8270 with Category B Deliverables. No SVOCs were detected above Protection of Groundwater SCOs within the bottom endpoint soil sample and the south, east and west sidewall endpoint samples. However, SVOCs were detected above Protection of Groundwater SCOs within the endpoint soil sample collected from the north sidewall.

On April 24, 2017, EBC collected an additional sidewall endpoint soil sample (sample ID EP4-1A) following additional excavation of SVOC Hotspot to expand the excavation 1 ft farther to the north. The endpoint soil sample was submitted to Phoenix for laboratory for analysis of TCL SVOCs by EPA Method 8270 with Category B Deliverables. No SVOCs were detected above Protection of Groundwater SCOs within the endpoint sidewall sample.

A copy of the laboratory report(s) for the bottom and sidewall endpoint verification soil samples collected from the SVOC Hotspot 4 is attached in Appendix R1. The results are summarized and compared to NYSDEC Part 375.6 Unrestricted Use SCOs, Restricted Residential Use SCOs, and Protection of Groundwater SCOs in Tables 23 through 26. Data Usability Summary Reports (DUSRs) were prepared for all data generated in this remedial performance evaluation program. DUSRs are included in Appendix T.

4.4.2.5 SVOC Hotspot 5 (B34)

Following removal of the loading bay building slab and underlying fill, additional excavation of a 10ft by 10ft wide area to a depth of 3 ft was performed at the location of soil boring B34 (identified as SVOC Hotspot 5). On March 30, 2017, EBC collected on endpoint soil sample from the base of the excavation (sample ID EP5-5) and one endpoint soil sample from a depth of approximately 2ft from each of the four the sidewalls of the excavation (sample IDs EP5-1, EP5-2, EP5-3, and EP5-4). The collection location of each of the endpoint soil samples is shown on Figure 4. Each of the endpoint soil samples were submitted to Phoenix for laboratory for analysis of TCL SVOCs by EPA Method 8270 with Category B Deliverables. No SVOCs were detected above Protection of Groundwater SCOs within the bottom endpoint soil sample and the sidewall endpoint samples.

A copy of the laboratory report(s) for the bottom and sidewall endpoint verification soil samples collected from the SVOC Hotspot 5 is attached in Appendix R1. The results are summarized and compared to NYSDEC Part 375.6 Unrestricted Use SCOs, Restricted Residential Use SCOs, and Protection of Groundwater SCOs in Tables 23 through 26. Data Usability Summary Reports (DUSRs) were prepared for all data generated in this remedial performance evaluation program. DUSRs are included in Appendix T.

4.4.2.6 SVOC Hotspot 6 (B4)

An 10ft by 10ft wide excavation to a depth of 3 ft was excavated at the location of soil boring B4 (identified as SVOC Hotspot 6). On November 2, 2017, EBC collected on endpoint soil sample from the base of the excavation (sample ID HS6 Bottom) and one endpoint soil sample from a depth of approximately 2ft from each of the four the sidewalls of the excavation (sample IDs HS6 E, HS6 W, HS6 S, and HS6 N). The collection location of each of the endpoint soil samples is shown on Figure 4. Each of the endpoint soil samples were submitted to Phoenix for laboratory for analysis of TCL SVOCs by EPA Method 8270 with Category B Deliverables. No SVOCs were detected above Protection of Groundwater SCOs within the endpoint sidewall soil sample collected from the east side of the SVOC Hotspot 6 excavation. However, several SVOCs were detected above Protection of Groundwater SCOs within three other sidewall endpoint soil samples and the bottom endpoint soil sample. On November 8, 2017, EBC collected soil samples outward in 1 ft intervals from each of the sidewall samples (representing 11, 12, and 13 ft from the B4 boring location) at a depth of approximately 2 ft to delineate the horizontal extent of SVOC Hotspot 6 and a bottom soil sample from a depth of approximately 4 feet below grade (sample ID HS6 Bottom@4). The samples representing the next 1 ft interval outward in the west, north and south directions (11 ft from the B4 boring location) were submitted for laboratory analysis of SVOCs via EPA Method 8270 with Category B Deliverables. No SVOCs were detected above Protection of Groundwater SCOs within the endpoint soil sample collected to the west (sample ID HS6 W at 11) and south (sample ID HS6 S at 11). SVOCs were detected above Protection of Groundwater SCOs within the 11ft sample collected to the east (sample ID HS6 N at 11). Therefore, the sample collected from the next 1ft interval to the east (sample ID HS6N @ 12) was submitted for laboratory analysis of SVOCs via EPA Method 8270 with Category B Deliverables. No SVOCs were detected above Protection of Groundwater SCOs within the sample collected 2ft east of the SVOC Hotspot 6 excavation.

A copy of each of the laboratory reports for the bottom and sidewall endpoint verification soil samples collected from the SVOC Hotspot 6 is attached in Appendix R1. The results are summarized and compared to NYSDEC Part 375.6 Unrestricted Use SCOs, Restricted Residential Use SCOs, and Protection of Groundwater SCOs in Tables 23 through 26. Data

Usability Summary Reports (DUSRs) were prepared for all data generated in this remedial performance evaluation program. DUSRs are included in Appendix T.

4.4.3 Building C Endpoint Soil Sampling

The RAWP specified the collection and laboratory analysis of endpoint samples at a rate of one endpoint soil sample per 900 ft^2 following excavation to verify that remedial goals had been achieved. Therefore, the area excavated for the cellar for Building C was divided into 28 separate Grid Sections of 900 ft^2 or less, and one endpoint verification soil sample was collected from each of the 28 Grid Sections (A1 through A7, B1 through B7, C1 through C7, and D1 through D7) to verify that remedial goals had been achieved. The collection location of each of the endpoint verification soil samples is shown on Figure 4.

In accordance with DER-10, the 28 endpoint verification soil samples meet the sampling frequency of one per 900 ft^2. Each of the endpoint soil samples were submitted to Phoenix for laboratory for analysis of TCL VOCs and SVOCs according to EPA Methods 8260 and 8270, pesticides/PCBs by EPA Method 8081/ 8082 and TAL metals with Category B Deliverables.

No VOCs, SVOCs, pesticides, PCBs or metals were detected above Track 1 Unrestricted Use SCOs. The results of the 28 endpoint soil samples collected from the base of the cellar excavation for Building C confirms that all soil remaining at the Site meets Unrestricted Use SCOs.

A copy of each of the laboratory reports for the endpoint soil samples collected following excavation for the cellar for Building C is attached in Appendix R3. The results are summarized and compared to NYSDEC Part 375.6 Unrestricted Use SCOs, Restricted Residential Use SCOs, and Protection of Groundwater SCOs in Tables 23 through 26. Data Usability Summary Reports (DUSRs) were prepared for all data generated in this remedial performance evaluation program. DUSRs are included in Appendix T.

4.5 IMPORTED BACKFILL

4.5.1 Native Soil from Other Redevelopment/Remedial Projects

4.5.1.1 Block 3152 - 89-141 Melrose Street (15CVCP073K)

On April 4, 2016, EBC emailed a request to import 700 cubic yards of clean native soil from a

remedial project enrolled in the New York City Voluntary Cleanup Program (NYC OER Site No. 15CVCP073K) located at 89 to 141 Melrose Street in Brooklyn, New York 11206 (Block 3152, Lot 48). The request included the test pit sampling plan and laboratory results of two 5-point composite soil samples and 6 grab soil samples. The results of soil samples collected from the native soil proposed for transport to the Site indicated the soil met Unrestricted Use SCOs and Protection of Groundwater SCOs. An email from NYSDEC (dated April 5, 2016) approved import of the requested 700 cubic yards of clean native soil to the Site. A copy of the email request and NYSDEC approval email is included in Appendix O1.

On June 7, 2016, a total of 40 truck loads, each with a capacity of approximately 20 cubic yards (total of approximately 800 cubic yards), was transported to the Site to backfill the cellar area of the former 2-story building. Copies of each of the haul tickets are included in Appendix O1.

4.5.1.2 744 Bedford Avenue (BCP Site No. C224193)

On July 20, 2017, AMC submitted a Request to Import/Reuse Fill or Soil form to the NYSDEC to request approval to import 1,000 cubic yards of clean native soil from a remedial project enrolled in the NYSDEC Brownfield Cleanup Program (BCP Site No. C224193) located at 744 Bedford Avenue in Brooklyn, New York 11205 (Block 1886, Lot 44). The Request to Import/Reuse Fill or Soil form summarized the laboratory results of the two 5-point composite soil samples and seven grab soil samples collected to determine suitability for use as backfill at the Site. The results of soil samples collected from the native soil proposed for transport to the Site indicated the soil met Unrestricted Use SCOs and Protection of Groundwater SCOs. A formal letter issued by the NYSDEC (dated July 24, 2017) approved import of the requested 1,000 cubic yards of clean native soil to the Site. A copy of the Request to Import/Reuse Fill or Soil form and NYSDEC approval letter is included in Appendix O2.

Additional soil samples were collected from the remaining clean native soil located at the 744 Bedford Avenue property to obtain approval for a larger quantity of clean native soil for transport to the Site. Supplemental sampling was performed on July 27, 2017, and included collection of two additional 5-point composite samples and seven grab samples. On August 1, 2017, AMC submitted a second Request to Import/Reuse Fill or Soil form to the NYSDEC to request approval to transport an additional 2,500 cubic yards clean native soil from the 744

Bedford Avenue property to the Site. The results of soil samples collected from the native soil proposed for transport to the Site indicated the soil met Unrestricted Use SCOs and Protection of Groundwater SCOs. A formal letter issued by the NYSDEC (dated August 4, 2017) approved import of the requested 2,500 cubic yards of clean native soil to the Site. A copy of the Request to Import/Reuse Fill or Soil form and NYSDEC approval letter is included in Appendix O2.
From July 26, 2017, to September 14, 2017, a total of 133 truck loads of clean native soil, each with a capacity of approximately 20 cubic yards (total of approximately 2,660 cubic yards), was transported to the Site for use as backfill in the area of the former terminal platform building (loading dock). Copies of each of the haul tickets are included in Appendix O2.

4.5.1.3 948 Myrtle Avenue (15CVCP132K)

On August 7, 2017, AMC submitted a Request to Import/Reuse Fill or Soil form to the NYSDEC to request approval to import 1,000 cubic yards of clean native soil from a remedial project enrolled in the New York City Voluntary Cleanup Program (NYC OER Site No. 15CVCP132K) located at 948 Myrtle Avenue in Brooklyn, New York 11206 (Block 1756, Lot 37). The Request to Import/Reuse Fill or Soil form summarized the laboratory results of the two 5-point composite soil samples and 7 grab soil samples collected to determine suitability for use as backfill at the Site. The results of soil samples collected from the native soil proposed for transport to the Site indicated the soil met Unrestricted Use SCOs and Protection of Groundwater SCOs. A formal letter issued by the NYSDEC (dated August 9, 2017) approved import of the requested 1,000 cubic yards of clean native soil to the Site. A copy of the Request to Import/Reuse Fill or Soil form and NYSDEC approval letter is included in Appendix O3.

Additional soil samples were collected from the remaining clean native soil located at the 948 Myrtle Avenue property to obtain approval for a larger quantity of clean native soil for transport to the Site. Supplemental sampling was performed on August 8, 2017, and included collection of three additional 5-point composite samples and ten grab samples. On August 11, 2017, AMC submitted a second Request to Import/Reuse Fill or Soil form to the NYSDEC to request approval to transport an additional 6,500 cubic yards clean native soil from the 948 Myrtle Avenue property to the Site. The Request to Import/Reuse Fill or Soil form summarized the supplemental sampling performed on August 8, 2017. The results of soil samples collected from the native soil proposed for transport to the Site indicated the soil met Unrestricted Use SCOs

and Protection of Groundwater SCOs. A formal letter issued by the NYSDEC (dated August 16, 2017) approved import of the requested 6,500 cubic yards of clean native soil to the Site. A copy of the Request to Import/Reuse Fill or Soil form and NYSDEC approval letter is included in Appendix O3.

From August 23, 2017, to December 13, 2017, a total of 202 truck loads of clean native soil, each with a capacity of approximately 20 cubic yards (total of approximately 4,040 cubic yards), was transported to the Site for use as backfill in the surcharge area. Copies of each of the haul tickets are included in Appendix O3.

4.5.1.4 902 to 908 Flushing Avenue (15CVCP132K)

On November 9, 2017, AMC submitted a Request to Import/Reuse Fill or Soil form to the NYSDEC to request approval to import 4,000 cubic yards of clean native soil from a remedial project enrolled in the New York City Voluntary Cleanup Program (NYC OER Site No. 15CVCP132K) located at 902 to 908 Flushing Avenue in Brooklyn, New York 11206 (Block 3139, Lot 21). The Request to Import/Reuse Fill or Soil form summarized the laboratory results of the five 5-point composite soil samples and fourteen grab soil samples collected to determine suitability for use as backfill at the Site. The results of soil samples collected from the native soil proposed for transport to the Site indicated the soil met Unrestricted Use SCOs and Protection of Groundwater SCOs. A formal letter issued by the NYSDEC (dated November 14, 2017) approved import of the requested 4,000 cubic yards of clean native soil to the Site. A copy of the Request to Import/Reuse Fill or Soil form and NYSDEC approval letter is included in Appendix O4.

Following transport of 4,000 cubic yards of clean native soil to 11 West Street from the 902 to 908 Flushing Avenue property, additional waste characterization soil samples were collected from the remaining clean native soil located at the 902-908 Flushing Avenue property to obtain approval for a larger quantity of clean native soil for transport to the Site. Supplemental sampling was performed on November 27, 2017, and included the collection of five additional 5-point composite samples and thirteen grab samples. On November 29, 2017, AMC submitted a second Request to Import/Reuse Fill or Soil form to the NYSDEC to request approval to transport an additional 3,500 cubic yards clean native soil from the 902 to 908 Flushing Avenue property to

the Site. The results of soil samples collected from the native soil proposed for transport to the Site indicated the soil met Unrestricted Use SCOs and Protection of Groundwater SCOs. A formal letter issued by the NYSDEC (dated December 5, 2017) approved import of the requested 3,500 cubic yards of clean native soil to the Site. A copy of the Request to Import/Reuse Fill or Soil form and NYSDEC approval letter is included in Appendix O4.

From November 16, 2017, to January 18, 2018, a total of 350 truck loads of clean native soil, each with a capacity of approximately 20 cubic yards (total of approximately 7,000 cubic yards), was transported to the Site for use as backfill in the surcharge area. Copies of each of the haul tickets are included in Appendix O4.

4.5.1.5 629 to 633 Marcy Avenue (17CVCP060K)

On November 17, 2017, AMC submitted a Request to Import/Reuse Fill or Soil form to the NYSDEC to request approval to import 2,000 cubic yards of clean native soil from a remedial project enrolled in the New York City Voluntary Cleanup Program (NYC OER Site No. 17CVCP060K) located at 629 to 633 Marcy Avenue in Brooklyn, New York 11206 (Block 1771, Lot 5). The Request to Import/Reuse Fill or Soil form summarized the laboratory results of the three 5-point composite soil samples and 10 grab soil samples collected to determine suitability for use as backfill at the Site. The results of soil samples collected from the native soil proposed for transport to the Site indicated the soil met Unrestricted Use SCOs. A formal letter issued by the NYSDEC (dated November 22, 2017) approved import of the requested 2,000 cubic yards of clean native soil to the Site. A copy of the Request to Import/Reuse Fill or Soil form and NYSDEC approval letter is included in Appendix O5.

Following transport of 2,000 cubic yards of clean native soil to 11 West Street from the 629 to 633 Marcy Avenue property, additional waste characterization soil samples were collected from the remaining clean native soil located at the 629 to 633 Marcy Avenue property to obtain approval for a larger quantity of clean native soil for transport to the Site. Supplemental sampling was performed on December 4, 2017, and included the collection of two additional 5-point composite samples and seven grab samples. On December 6, 2017, AMC submitted a second Request to Import/Reuse Fill or Soil form to the NYSDEC to request approval to transport an additional 600 cubic yards clean native soil from the 629 to 633 Marcy Avenue property to the Site. The results of soil samples collected from the native soil proposed for transport to the Site

indicated the soil met Unrestricted Use SCOs and Protection of Groundwater SCOs. A formal letter issued by the NYSDEC (dated December 7, 2017) approved import of the requested 600 cubic yards of clean native soil to the Site. A copy of the Request to Import/Reuse Fill or Soil form and NYSDEC approval letter is included in Appendix O5.

Following transport of the additionally approved 600 cubic yards of clean native soil to 11 West Street from the 629 to 633 Marcy Avenue property, AMC submitted a third Request to Import/Reuse Fill or Soil form (dated 12/21/2017) to the NYSDEC to request approval to transport an additional 400 cubic yards clean native soil from the 629 to 633 Marcy Avenue property to the Site. The Request to Import/Reuse Fill or Soil form was submitted to update the quantity previously proposed in the second submission. A formal letter issued by the NYSDEC (dated December 26, 2017) approved import of the requested 400 cubic yards of clean native soil to the Site. A copy of the Request to Import/Reuse Fill or Soil form and NYSDEC approval letter is included in Appendix O5.

From November 22, 2017, to December 29, 2017, a total of 139 truck loads of clean native soil, each with a capacity of approximately 20 cubic yards (total of approximately 2,780 cubic yards), was transported to the Site for use as backfill in the surcharge area. Copies of each of the haul tickets are included in Appendix O5.

4.5.1.6 143-18 Liberty Avenue (17CVCP006Q)

On December 11, 2017, AMC submitted a Request to Import/Reuse Fill or Soil form to the NYSDEC to request approval to import 5,574 cubic yards of clean native soil from a remedial project enrolled in the New York City Voluntary Cleanup Program (NYC OER Site No. 17CVCP006Q) located at 143-18 Liberty Avenue in Queens, New York 11435 (Block 10041, Lot 6). The Request to Import/Reuse Fill or Soil form summarized the laboratory results of the ten 5-point composite soil samples and twenty-two grab soil samples collected to determine suitability for use as backfill at the Site. The results of all samples collected from the native soil proposed for transport to the Site indicated the soil met Unrestricted Use SCOs. A formal letter issued by the NYSDEC (dated December 15, 2017) approved import of the requested 5,574 cubic yards of clean native soil to the Site. A copy of the Request to Import/Reuse Fill or Soil form and NYSDEC approval letter is included in Appendix O6.

From December 19, 2017, to April 13, 2018, a total of 141 truck loads of clean native soil, each with a capacity of approximately 30 cubic yards (total of approximately 4,230 cubic yards), was transported to the Site for use as backfill in the surcharge area. Copies of each of the haul tickets are included in Appendix O6.

4.5.1.7 886 Dahill Road (10EH-N025K)

On December 12, 2017, AMC submitted a Request to Import/Reuse Fill or Soil form to the NYSDEC to request approval to import 5,000 cubic yards of clean native soil from a redevelopment project undergoing remediation in accordance with a Remedial Action Work Plan approved by the New York City Office of Environmental Remediation (NYC OER Site No. 10EH-N025K) located at 886 Dahill Road in Brooklyn, New York 11204 (Block 5457, Lot 6). The Request to Import/Reuse Fill or Soil form summarized the laboratory results of six 5-point composite soil samples and 18 grab soil samples collected to determine suitability for use as backfill at the Site. The results of soil samples collected from the native soil proposed for transport to the Site indicated the soil met Unrestricted Use SCOs and Protection of Groundwater SCOs. A formal letter issued by the NYSDEC (dated December 15, 2017) approved import of the requested 5,000 cubic yards of clean native soil to the Site. A copy of the Request to Import/Reuse Fill or Soil form and NYSDEC approval letter is included in Appendix O7.

From December 27, 2017 to January 3, 2018, a total of 141 truck loads of clean native soil, each with a capacity of approximately 20 cubic yards (total of approximately 2,820 cubic yards), was transported to the Site for use as backfill in the surcharge area. Copies of each of the haul tickets are included in Appendix O7.

4.5.1.8 650 Metropolitan Avenue (13CVCP071K)

On December 19, 2017, AMC submitted a Request to Import/Reuse Fill or Soil form to the NYSDEC to request approval to import 800 cubic yards of clean native soil from a remedial project enrolled in the New York City Voluntary Cleanup Program (NYC OER Site No. 13CVCP071K) located at 650 Metropolitan Avenue in Brooklyn, New York 11211 (Block 2763, Lot 11). The Request to Import/Reuse Fill or Soil form summarized the laboratory results of the two 5-point composite soil samples and seven grab soil samples collected to determine suitability for use as backfill at the Site. The results of all samples collected from the native soil proposed

for transport to the Site indicated the soil met Unrestricted Use SCOs and Protection of Groundwater SCOs. A formal letter issued by the NYSDEC (dated December 28, 2017) approved import of the requested 800 cubic yards of clean native soil to the Site. A copy of the Request to Import/Reuse Fill or Soil form and NYSDEC approval letter is included in Appendix O8.

From January 17, 2018 to February 22, 2018 a total of 39 truck loads of clean native soil, each with a capacity of approximately 30 cubic yards (total of approximately 780 cubic yards), was transported to the Site for use as backfill in the surcharge area. Copies of each of the haul tickets are included in Appendix O8.

4.5.1.9 263 South 5th Street (The Dime)

On January 9, 2018, AMC submitted a Request to Import/Reuse Fill or Soil form to the NYSDEC to request approval to import 9,000 cubic yards of clean native soil to be excavated to install a new building's cellar from a redevelopment project located at 263 South 5th Street in Brooklyn, New York 11205 (Block 2447, Lot 35). The Request to Import/Reuse Fill or Soil form summarized the laboratory results of sixteen 5-point composite soil samples and twenty-four grab soil samples collected to determine suitability for use as backfill at the Site. The results of soil samples collected from the native soil proposed for transport to the Site indicated the soil met Unrestricted Use SCOs and Protection of Groundwater SCOs. A formal letter issued by the NYSDEC (dated January 29, 2018) approved import of the 7,000 cubic yards of clean native soil to the Site. A copy of the Request to Import/Reuse Fill or Soil form and NYSDEC approval letter is included in Appendix O9.

Additional soil samples were collected from the remaining clean native soil located at the 263 South 5th Street property to obtain approval for a larger quantity of clean native soil for transport to the Site. Supplemental sampling was performed on February 1, 2018, and included collection of four additional 5-point composite samples and fourteen grab samples. Prior data collected from a separate environmental consultant in 2017 included four composite samples and four grab samples. On February 7, 2018, AMC submitted a second Request to Import/Reuse Fill or Soil form to the NYSDEC to request approval to transport an additional 7,000 cubic yards clean native soil from the 263 South 5th Street property to the Site. The results of soil samples collected

from the native soil proposed for transport to the Site indicated the soil met Unrestricted Use SCOs and Protection of Groundwater SCOs. A formal letter issued by the NYSDEC (dated February 12, 2018) approved import of the requested 7,000 cubic yards of clean native soil to the Site. A copy of the Request to Import/Reuse Fill or Soil form and NYSDEC approval letter is included in Appendix O9.

From January 30, 2018, to March 28, 2018, a total of 700 truck loads of clean native soil, each with a capacity of approximately 20 cubic yards (total of approximately 14,000 cubic yards), was transported to the Site for use as backfill in the surcharge area. Copies of each of the haul tickets are included in Appendix O9.

4.5.2 Quarry Stone

4.5.2.1 Off-Site Virgin Mined Stone for Shoreline

The developer imported three different sizes of stone from Braen Stone of Sparta for use as backfill and to construct the waterfront shoreline located immediately west of the Site. Braen Stone of Sparta is a quarry located at 217 Limecrest Road in Lafayette, New Jersey. A copy of the Mine Registration Certificate is included in Appendix P1.

- From January 16, 2019, to May 31, 2019, a total of approximately 253.93 tons of 2-1/2 inch virgin mined stone was imported to the Site for use off-Site as backfill along the waterfront bulkhead. A copy of facility generated scale ticket for each load is included in Appendix P1.

- From December 20, 2018, to February 12, 2019, a total of approximately 372.08 tons of 18 inch virgin mined stone was imported to the Site for use off-Site as backfill along the waterfront bulkhead. A copy of facility generated scale ticket for each load is included in Appendix P1.

- From February 26, 2019, to March 7, 2019, a total of approximately 103.02 tons of 3/8 inch virgin mined stone was imported to the Site for use off-Site as backfill along the waterfront bulkhead. A copy of facility generated scale ticket for each load is included in Appendix P1.

The developer imported 3 to 5 inch stone (Limestone No. 5) from Holbert Quarry located in Lackawaxen, Pennsylvania for use as backfill off-Site along the waterfront bulkhead. From October 17, 2018, to December 13, 2018, a total of approximately 1,491.89 tons of 3 to 5 inch (Limestone No. 5) virgin mined stone was imported for use off-Site as backfill along the waterfront bulkhead. A copy of facility generated scale ticket from the stone supplier (New York Sand & Stone) for each load is included in Appendix P1.

The developer imported oversized stone / rip rap (Lime Medium Stone) from Holbert Quarry located in Lackawaxen, Pennsylvania for use as backfill off-Site along the waterfront bulkhead. From November 19, 2018, to December 10, 2018, a total of 38 truck loads rip rap (Lime Medium Stone) for use off-Site as backfill along the waterfront bulkhead. A copy of facility generated scale ticket from the stone supplier (New York Sand & Stone) for each load is included in Appendix P1.

On October 4, 2019, imported 2 to 6 inch stone from Holbert Quarry located in Lackawaxen, Pennsylvania for use as backfill off-Site along the waterfront bulkhead. From October 4, 2018, to October 5, 2018, a total of 97.26 tons of 2 to 6 inch stone was imported for use off-Site as backfill along the waterfront bulkhead. A copy of facility generated scale ticket Quarry Management Holdings LLC for each load is included in Appendix P5.

On October 4, 2019, one truck load (24.63 tons) of 12 to 24 inch stone was imported from Holbert Quarry located in Lackawaxen, Pennsylvania for use as backfill off-Site along the waterfront bulkhead. A copy of facility generated scale ticket Quarry Management Holdings LLC for the load is included in Appendix P5.

4.5.2.2 ¾" Bluestone from Braen Stone of Sparta

On October 10, 2018, AMC submitted a Request to Import/Reuse Fill or Soil form to the NYSDEC to request approval to import up to 1,000 cubic yards of ¾ inch virgin mined stone (ASTM 57) from Braen Stone of Sparta for use as backfill behind the waterfront bulkhead. Braen Stone of Sparta is a quarry located at 217 Limecrest Road in Lafayette, New Jersey. The request included a copy of the Mine Registration Certificate and a sieve analysis representative of proposed ASTM 57 (3/4 inch stone). A copy of the Request to Import/Reuse Fill or Soil form

is included in Appendix P1.

From October 11, 2018, to April 29, 2019, a total of approximately 764.03 tons of ¾ inch (ASTM 57) virgin mined stone was imported to the Site for use as backfill along the waterfront bulkhead. A copy of facility generated scale ticket for each load is included in Appendix P1.

4.5.2.3 Off-Site Virgin Mined Stone for Shoreline

On October 5, 2018, an email request was submitted to NYSDEC to request approval to import three different sizes of virgin mined quarry stone from Holbert Quarry located in Lackawaxen, Pennsylvania, for off-Site use along the shoreline. The proposed sizes included 2 to 6 inch stone, 12 to 18 inch stone, and ASTM #57 stone (3/4 inch).

From January 16, 2019, to May 31, 2019, a total of approximately 253.93 tons of 2-1/2 inch virgin mined stone was imported to the Site for use as backfill along the waterfront bulkhead. A copy of facility generated scale ticket for each load is included in Appendix P1.

4.5.2.4 ¾" Bluestone from LaFarge Ravena Plant

On September 20, 2017, and September 26, 2017, a total of 429.97 tons of ¾ inch virgin mined stone (ASTM 57) from the LaFarge Ravena Plant. The LaFarge Ravena Plant is a quarry located at 1916 US Route 9W, in Ravena, New YorkA copy of the permit for operation of the mine and a sieve analysis representative of proposed ASTM 57 (3/4 inch stone) is included in Appendix P3. The inch virgin mined stone (ASTM 57) was used as a sub-base below the asphalt pavement applied over the area of the former terminal platform building (loading dock) after it was backfilled with clean native soil.

On July 18, 2019, AMC submitted a Request to Import/Reuse Fill or Soil form to the NYSDEC to request approval to import up to 800 cubic yards of ¾ inch virgin mined stone (ASTM 57) from the LaFarge Ravena Plant. The LaFarge Ravena Plant is a quarry located at 1916 US Route 9W, in Ravena, New York. The request included a copy of the permit for operation of the mine and a sieve analysis representative of proposed ASTM 57 (3/4 inch stone). A formal letter issued by the NYSDEC (dated July 22, 2019) approved import of the requested 500 to 800 cubic yards of ¾ inch virgin mined stone (ASTM 57) to the Site. A copy of the Request to Import/Reuse Fill or Soil form and NYSDEC approval letter is included in Appendix P3.

From August 8, 2018, to September 20, 2019, a total of approximately 852.85 tons of ¾ inch (ASTM 57) virgin mined stone was imported to the Site for use as a sub-base below the asphalt pavement re-applied to cap portions of the Site, within the sewer connection trench below the sewer pipe, and as a structural backfill material below concrete footings installed for foundation of Building C and Building B. A copy of facility generated scale ticket for each load is included in Appendix P1.

4.5.2.5 ¾" Bluestone from Tilcon

On August 7, 2019, AMC submitted a Request to Import/Reuse Fill or Soil form to the NYSDEC to request approval to import up to 1,000 cubic yards of ¾ inch virgin mined stone (ASTM 57) from the Tilcon NY Inc. – Mt. Hope Quarry. The Tilcon NY Inc. – Mt. Hope Quarry is a quarry located at 625 Mt. Hope Road, in Wharton, New Jersey. The request included a copy of the permit for operation of the mine and a sieve analysis representative of proposed ASTM 57 (¾ inch stone). A formal letter issued by the NYSDEC (dated August 9, 2019) approved import of the requested 1,000 cubic yards of ¾ inch virgin mined stone (ASTM 57) to the Site. A copy of the Request to Import/Reuse Fill or Soil form and NYSDEC approval letter is included in Appendix P4.

From September 5, 2019, to September 10, 2019, a total of approximately 126.92 tons of ¾ inch (ASTM 57) virgin mined stone was imported to the Site for use as a sub-base below the asphalt pavement re-applied to cap portions of the Site, and as a structural backfill material below concrete footings installed for foundation of Building C and Building B. A copy of facility generated scale ticket for each load is included in Appendix P4.

A table of all sources of imported backfill with quantities for each source is provided in the table below.

Source	Material Type	Quantity	Area Used
NYC OER Project No. (15CVCP073K) Block 3152 – 89-141 Melrose Street Brooklyn, New York 11206	Soil Meeting UU and POG SCOs	800 yd^3	Backfilled Former raised terminal platform building

BCP Site No. C224193 744 Bedford Avenue Brooklyn, New York 11205	Soil Meeting UU and POG SCOs	2,660 yd^3	Soil Surcharge Area
NYC OER Project No. (15CVCP132K) 948 Myrtle Avenue Brooklyn, New York 11205	Soil Meeting UU and POG SCOs	4,040 yd^3	Soil Surcharge Area
NYC OER Project No. (15CVCP084K) 902 to 908 Flushing Avenue Brooklyn, New York 11205	Soil Meeting UU and POG SCOs	7,000 yd^3	Soil Surcharge Area
NYC OER Project No. (17CVCP060K) 629 to 633 Flushing Avenue Brooklyn, New York 11205	Soil Meeting UU and POG SCOs	2,780 yd^3	Soil Surcharge Area
NYC OER Project No. (17CVCP006Q) 143-18 Liberty Avenue Queens, New York 11205	Soil Meeting UU and POG SCOs	4,230 yd^3	Soil Surcharge Area
NYC OER Project No. (10EH-N025K) 886 Dahill Road Brooklyn, NY 11204	Soil Meeting UU and POG SCOs	2,820 yd^3	Soil Surcharge Area
NYC OER Project No. (13CVCP071K) 650 Metropolitan Avenue Brooklyn, NY 11211	Soil Meeting UU and POG SCOs	780 yd^3	Soil Surcharge Area
Redevelopment Project (The Dime) 263 South 5th Street Brooklyn, NY 11205	Soil Meeting UU and POG SCOs	14,000 yd^3	Soil Surcharge Area
Braen Stone of Sparta 217 Limecrest Road Lafayette, New Jersey	2 ½" Stone	253.93 tons	Off-Site - Shoreline
Braen Stone of Sparta 217 Limecrest Road Lafayette, New Jersey	18" Stone	372.08 tons	Off-Site - Shoreline
Braen Stone of Sparta 217 Limecrest Road Lafayette, New Jersey	3/8" Stone	103.02 tons	Off-Site - Shoreline
Holbert Quarry Lackawaxen, Pennsylvania	3 to 5 inch Stone	1,491.89 tons	Off-Site - Shoreline
Holbert Quarry Lackawaxen, Pennsylvania	Oversized Stone / Rip Rap	760 cubic yards	Off-Site - Shoreline
Holbert Quarry Lackawaxen, Pennsylvania	2 to 6" Stone	97.26 tons	Off-Site - Shoreline
Holbert Quarry Lackawaxen, Pennsylvania	12 to 24" Stone	24.63 tons	Off-Site - Shoreline

Braen Stone of Sparta 217 Limecrest Road Lafayette, New Jersey	¾" Stone	764.03 tons	On-Site - Shoreline
Holbert Quarry Lackawaxen, Pennsylvania	2 ½" Stone	253.93 tons	On-Site - Shoreline
LaFarge Ravena Plant 1916 US Route 9W Ravena, New York	¾" Stone	852.85 tons	Asphalt Sub-Base and Building B and Building C Structural Backfill
Tilcon NY Inc. – Mt. Hope Quarry 625 Mt. Hope Road Wharton, New Jersey	¾" Stone	126.92 tons	Asphalt Sub-Base and Building B and Building C Structural Backfill

4.6 CONTAMINATION REMAINING AT THE SITE

4.6.1 Soil

The Remedial Investigation identified historic fill material across the Site to depths as great as 7 feet below grade. The historic fill material contains SVOCs, and metals including arsenic, barium, copper, chromium, lead, mercury, nickel and zinc above Unrestricted Use and/or Restricted Residential Use SCOs.

Six "hotspot" areas of elevated SVOCs related to fill materials were identified in RI soil borings B4 (Hotspot 6), B6 (Hotspot 3), B17 (Hotspot 1), B19 (Hotspot 2), B32 (Hotspot 4) and B34 (Hotspot 5). Although the SVOCs in these areas were not related to a petroleum release, the presence of low but elevated (above standards) SVOCs in groundwater suggest that these areas may have been affecting groundwater quality. In accordance with the RAWP, each of the SVOC hotspots was removed by excavating a 10 ft by 10 ft area to 3 to 4 feet below grade. Endpoint soil samples were collected for laboratory analysis of SVOCs (EPA Method 8270) from each of the sidewalls and bottom of each SVOC hot-spot. Additional excavation was performed of the SVOC hotspots as needed to achieve Protection of Groundwater SCOs for SVOCs present in groundwater above AWQSGVs.

Petroleum impacted soil was encountered to a depth of 8 ft in the vicinity of RI soil borings B21 and B22 within the former UST and dispensers area. This area was identified as the former fueling area hotspot. In accordance with the RAWP, the petroleum impacted soil within the former fueling area hotspot was removed. The resulting excavation was approximately 180 feet long by 60 feet wide and approximately 10 feet deep. Endpoint soil samples were collected for

laboratory analysis of VOCs (EPA Method 8260) and SVOCs (EPA Method 8270) from the sidewalls and bottom of the former fueling area hotspot excavation to confirm Protection of Groundwater SCOs were achieved for SVOCs present in groundwater above AWQSGVs.

Installation of the concrete mat slab and cellar slab of the new building Tower C2 required excavation/removal of all historic fill material within the area of the building. Soil below the concrete mat slab and cellar slab consists of native soil.

Residual historic fill material containing SVOCs, and metals above Unrestricted Use and/or Restricted Residential Use SCOs is capped in place by a composite cover system.

Table 29 and Figure 4 summarize the results of all soil samples collected that exceed Unrestricted Use SCOs, Protection of Groundwater SCOs, and Restricted Residential Use SCOs at the Site after completion of remedial action.

4.6.2 Groundwater

The laboratory results of the groundwater samples collected during the RI did not identify any VOCs, pesticides or PCBs at concentrations above AWQSGVs in any of the monitoring wells installed at the Site. SVOC detections above groundwater standards were limited to parameters with a groundwater standard of 2 parts per trillion as follows:

- Benzo(a)anthracene - Reported in 11 wells ranging from 0.03 - 0.32 µg/L
- Benzo(a)pyrene - Reported in 8 wells ranging from 0.02 - 0.29 µg/L
- Benzo(b)fluoranthene - Reported in 10 wells ranging from 0.03 - 0.47 µg/L
- Benzo(k)fluoranthene - Reported in 7 wells ranging from 0.03 - 0.18 µg/L
- Chrysene - Reported in 7 wells ranging from 0.04 - 0.29 µg/L
- Ideno(1,2,3-cd)pyrene - Reported in 7 wells ranging from 0.03 - 0.19 µg/L

The metals sodium (14 of 14) and manganese (11 of 14) were reported above AWQSGVs in the majority of the wells sampled during the RI. Iron was also reported above its standard in five of the monitoring wells and magnesium in four of the monitoring wells.

4.6.3 Soil Vapor

A soil vapor intrusion evaluation was completed and based on that evaluation, no additional

actions are need to address soil vapor intrusion at the Site. A sub-grade parking garage has been constructed beneath the entire on-site building, and the parking garage is ventilated in accordance with New York City Mechanical Code. In addition, the ventilation system has been designed to operate continuously. Therefore the soil vapor intrusion pathway has been adequately addressed.

4.7 ENGINEERING CONTROL SYSTEMS

4.7.1 Composite Cover System

Exposure to remaining contamination in soil/fill at the Site is prevented by a soil cover system placed over the Site. This cover system is comprised of the following:

- Area of Future Building/Tower B – Patchwork of existing asphalt, existing concrete, newly applied asphalt pavement with/without a ¾" stone sub-base, and areas of new concrete (minimum of 2 inches thick) installed around steel piles installed for Building B; (To be replaced with a concrete slab for Tower B under the SMP)
- Area of Future Portion of Building/Tower C to be Slab on Grade – A minimum of 2 inches of newly applied asphalt pavement with a ¾" stone sub-base, or a minimum of 2 inches of newly applied asphalt pavement without a sub-base;
  (To be replaced with a concrete slab for Tower C under the SMP)
- Area of Future Cellar Building/Tower C to have Cellar - A minimum of 2 inches of newly poured concrete installed across the entire cellar area of Building C and the sloped excavation area along the west side of the excavation;
  (To be replaced with a concrete slab for Tower C under the SMP)
- Area of Future Tower D to have Cellar – Patchwork of a minimum of 2 inches of asphalt installed after excavation/backfill of the loading dock, and newly applied asphalt pavement with/without a ¾" stone sub-base;
  (To be replaced with a concrete building slab for Tower D under the SMP)
- Area of Future Roadway and Waterfront Public Access Area (Surcharge Area) – A minimum of 2 feet of clean soil over a demarcation barrier;
  (Under the SMP, trenched excavation will be performed within the surcharge areas to install new utilities. The surcharge areas will then be finished as roadways, sidewalks, and landscaped areas)

- Pier/Waterfront Public Access Area (Asphalt) - A minimum of 2 inches of newly applied asphalt pavement with a ¾" stone sub-base, or a minimum of 2 inches of newly applied asphalt pavement without a sub-base;
  (To be removed under the SMP and replaced with new walkways and/or landscaped areas)

Figure 8 shows the as-built cross sections for each remedial cover type used on the site. Figure 6 shows the location of each cover type built at the Site. An Excavation Work Plan, which outlines the procedures required in the event the cover system and/or underlying residual contamination are disturbed, is provided in Appendix A of the SMP.

4.8 INSTITUTIONAL CONTROLS

The site remedy requires that an environmental easement be placed on the property to (1) implement, maintain and monitor the Engineering Controls; (2) prevent future exposure to remaining contamination by controlling disturbances of the subsurface contamination; and, (3) limit the use and development of the Site to restricted residential, commercial, or industrial uses only.

The environmental easement for the Site was executed by the Department on [date], and filed with the [County] County Clerk on [date]. The County Recording Identifier number for this filing is [number]. A copy of the easement and proof of filing is provided in Appendix B.

4.9 DEVIATIONS FROM THE REMEDIAL ACTION WORK PLAN

1) The RAWP identified the Fueling Area Hotspot as an area with a 25ft diameter to a depth of 10 feet below grade. However, delineation soil sampling performed prior to excavation identified the Fueling Area Hotspot as 180 feet long by 60 feet wide. The entire 180 feet long by 60 feet wide area was excavated to 10 feet to remove all petroleum contaminated soil. Endpoint soil samples collected from the Fueling Area Hotspot achieved SCOs.

2) The RAWP proposed excavation of a 10ft diameter around each of the six SVOC hotspots to removed soil/fill above Protection of Groundwater SCOs. However, endpoint soil samples collected from several of the SVOC hotspots noted additional excavation was required. Each of the SVOC hotspots were expanded as needed to remove

contaminated soil/fill, and follow-up endpoint soil sample results indicate remaining soil achieved Protection of Groundwater SCOs.

3) The BCP boundary was revised after DEC approval of the RAWP to exclude a portion of the property along the waterfront.

All soil cleanup objectives (SCOs) are in parts per million (ppm). NS=Not specified. See Technical Support Document (TSD). Footnotes

a The SCOs for residential, restricted-residential and ecological resources use were capped at a maximum value of 100 ppm. See TSD section 9.3.

b The SCOs for commercial use were capped at a maximum value of 500 ppm. See TSD section 9.3.

c The SCOs for industrial use and the protection of groundwater were capped at a maximum value of 1000 ppm. See TSD section 9.3.

d The SCOs for metals were capped at a maximum value of 10,000 ppm. See TSD section 9.3.

e For constituents where the calculated SCO was lower than the contract required quantitation limit (CRQL), the CRQL is used as the SCO value.

TABLE 3
Waste Characterization Sampling Summary

Grid Section/Area	Sample Collection Method	Number of Waste Characterization Soil Samples	Rationale for Sampling	Laboratory Analysis
Loading Dock	Area broken into 8 Grid Sections (A-H) 4 soil borings performed within each of the 8 Grid Sections to collect soil samples	8 – 5-pt Composite Soil Samples 8 Grab Soil Samples	To obtain soil disposal approval for soil to be excavated from the loading dock.	5-pt Composites - SVOCs (8270), TAL Metals pesticide / PCBs (8081/8082), RCRA characteristics, RCRA Metals. Grabs – VOCs (8260)
Loading Dock (supplemental)	Grid Sections A and B divided into A1, A2, B1, B2. Test pits were excavated within each of the smaller grid sections to collect soil samples representing 0-5ft.	4 – 5-pt Composite Soil Samples 4 Grab Soil Samples	To obtain soil disposal approval for additional soil/fill to be excavated from the loading dock because the original approved tonnage had been reached.	5-pt Composites - SVOCs (8270), RCRA Metals pesticide / PCBs, (8081/8082), RCRA Characteristics, TCLP Metals. Grabs – VOCs (8260)
Former Fueling Area Hotspot (initial)	Performed three soil borings within the RAWP proposed area of the Former Fueling Area Hotspot to collect soil samples representing 0-5ft and 5-10ft.	2 – 6-pt Composite Soil Samples 2 Grab Soil Samples	To obtain soil disposal approval for soil to be excavated from the loading dock.	6-pt Composites - SVOCs (8270), TAL Metals pesticide / PCBs / (8081/8082), RCRA characteristics, TCLP Metals. Grabs – VOCs (8260)
Former Fueling Area Hotspot (final)	Larger Hotspot Area broken into 5 Grid Sections (FA1, FA2, FA3, FA4, FA5). 5 soil borings performed within each of the 5 Grid Sections to collect soil samples representing 0-5ft and 5-10ft.	10 – 5-pt Composite Soil Samples 10 Grab Soil Samples	To obtain soil disposal approval for soil to be excavated from the loading dock.	5-pt Composites - SVOCs (8270), TAL Metals pesticide / PCBs / (8081/8082), RCRA characteristics, TCLP Metals. Grabs – VOCs (8260)
Cellar Area of Building C	Area broken into 3 colored Grid Sections (Red, Blue, Yellow). 5 soil borings performed within each of the 3 Grid Sections to collect soil samples representing 0-2ft, 2-4ft, 4-8ft, 8-12ft, 12-16ft.	15 – 5-pt Composite Soil Samples 15 Grab Soil Samples	To obtain soil disposal approval for soil/fill to be excavated for the cellar of Building C.	5-pt Composites - SVOCs (8270), TAL Metals pesticide / PCBs / herbicides (8081/8082), RCRA characteristics, EPH, TCLP Metals. Grabs – VOCs (8260)
Stormwater Sewer Trench Excavations	Two soil stockpiles (185 cubic yards and 325 cubic yards) generated by excavating trenches to install a sewer pipe. Grab samples collected from the stockpiles to form representative samples.	2 – 5-pt Composite Soil Samples 2 Grab Soil Samples	To obtain soil disposal approval for the two soil/fill stockpiles generated by excavating sewer trenches.	5-pt Composites - SVOCs (8270), TAL Metals pesticide / PCBs / herbicides (8081/8082), RCRA characteristics, EPH, TCLP Metals. Grabs – VOCs (8260)

TABLE 3
Waste Characterization Sampling Summary

C4/D4 Boundary Excavation	One soil stockpile generated by excavating the top 2ft of soil/fill from an area at the C4/D4 grid section boundary to install 2 ft of clean soil over a demarcation barrier. Grab samples collected from the stockpile to form representative samples.	1 – 5-pt Composite Soil Sample 1 Grab Soil Sample	To obtain soil disposal approval for the soil/fill stockpile generated by excavating the top 2ft of soil/fill at the C4/D4 grid section boundary.	5-pt Composite - SVOCs (8270), TAL Metals pesticide / PCBs / herbicides (8081/8082), RCRA characteristics, EPH, TCLP Metals. Grab – VOCs (8260)
B4 Excavation	One soil stockpile (400 cubic yards) generated by excavating the top 1 to 2ft of soil/fill from Grid Section B4 boundary to install 2 ft of clean soil over a demarcation barrier. Grab samples collected from the stockpile to form representative samples.	1 – 5-pt Composite Soil Sample 1 Grab Soil Sample	To obtain soil disposal approval for the soil/fill stockpile generated by excavating the top 1-2ft of soil/fill from Grid Section B4.	5-pt Composite - SVOCs (8270), TAL Metals pesticide / PCBs / herbicides (8081/8082), RCRA characteristics, EPH, TCLP Metals. Grab – VOCs (8260)
E2/West Street Boundary Excavation	Two soil stockpiles generated by excavating and stockpiling soil/fill from 0-2ft and 2-3ft from Grid Section E2 to install 2 ft of clean soil over a demarcation barrier. Grab samples collected from the stockpiles to form representative samples.	2 – 5-pt Composite Soil Samples 2 Grab Soil Sample	To obtain soil disposal approval for the two soil/fill stockpiles generated by excavating soil/fill from 0-2ft and 2-3ft from Grid Section E2.	5-pt Composite - SVOCs (8270), TAL Metals pesticide / PCBs / herbicides (8081/8082), RCRA characteristics, EPH, TCLP Metals. Grab – VOCs (8260)
Shoreline SB Comp(0-5) and SB Comp (5-10)	Performed five soil borings within the on-Site portion of the shoreline to collect soil samples representing 0-5ft, and 5-10ft.	2 – 5-pt Composite Soil Samples 2 Grab Soil Samples	To obtain soil disposal approval for the on-Site soil/fill to be excavated to install the bulkhead/pier along the shoreline.	5-pt Composites - SVOCs (8270), TAL Metals pesticide / PCBs / herbicides (8081/8082), RCRA characteristics, EPH, TCLP Metals. Grabs – VOCs (8260)
Shoreline Shorefront Comp	Five test pits were excavated within the off-Site portion of the shoreline to collect soil samples representative of the soil/fill to be removed from the off-Site shoreline area.	1 – 5-pt Composite Soil Sample 1 Grab Soil Sample	To obtain soil disposal approval for the off-Site soil/fill to be excavated to install the bulkhead/pier along the shoreline.	5-pt Composite - SVOCs (8270), TAL Metals pesticide / PCBs / herbicides (8081/8082), RCRA characteristics, EPH, TCLP Metals. Grab – VOCs (8260)
Shoreline Waterfront North Shoreline North	Test pits were excavated within the on-Site and off-Site areas on the north end of the shoreline to collect soil samples representative of the soil/fill to be removed from the area.	2 – 5-pt Composite Soil Samples 2 Grab Soil Samples	To obtain soil disposal approval for the soil/fill to be excavated to install the bulkhead/pier along the north end of the shoreline.	5-pt Composites - SVOCs (8270), TAL Metals pesticide / PCBs / herbicides (8081/8082), RCRA characteristics, EPH, TCLP Metals. Grabs – VOCs (8260)
