RE: Results of Soil-Vapor Investigation
Materials Research Corporation
542 Route 303
Orangetown, Rockland County
Site ID No. V-00317-3

Dear Mr. Candiloro:

Sony Electronics Inc. (Sony) retained Leggette, Brashears & Graham, Inc. (LBG) to complete a soil-vapor investigation (SVI) at the site of the Materials Research Corporation (MRC) facility in Orangetown, New York (figure 1). The SVI was conducted in accordance with the "Work Plan Amendment" and December 23, 2003 "Work Plan Amendment Comments". The aforementioned responses were approved by the New York State Department of Environmental Conservation (NYSDEC) on December 23, 2003.

FIELD ACTIVITIES

On December 29, 2003, LBG collected nine soil-vapor samples from beneath the concrete floor slab of the western half of the Materials Research Corporation (MRC) facility. This portion of the building, which was constructed nine years after the eastern half, was the focus of the investigation because it was identified as a potential source area of volatile organic

compounds (VOCs) during the November 2002 Environmental Site Investigation (ESI) conducted by LBG. Mr. James Candiloro of the NYSDEC and Ms. Faye Navratil of the New York State Department of Health (NYSDOH) were present to observe the soil-vapor sampling procedures.

The soil-vapor samples, designated as SV-1 through SV-9, were collected throughout the western portion of the MCR building in an approximate grid pattern (as shown on figures 2 and 3). Specific locations were determined in the field by NYSDEC and NYSDOH personnel. The collection procedure consisted of drilling an approximately $\frac{1}{2}$ -inch diameter borehole through the concrete slab floor and then driving a $\frac{3}{8}$ -inch to $\frac{1}{2}$ -inch diameter hole approximately 6 inches into the sub-slab aggregate using a slam bar. A stainless-steel probe with a perforated section at the end was inserted into the hole and sealed at grade with a silicon gel to reduce or eliminate dilution of the soil-vapor sample with ambient air. Tygon tubing was attached to the top of the stainless-steel probe and sealed with silicon gel. It has been verified that no constituents of concern are contained in the silicon gel used. Once the sampling point had been set up, approximately one volume of ambient air from within the sample tube and the borehole was purged by inserting the Tygon tubing into a peristaltic pump. The purge volume was measured by discharging the air into a 1-liter Teflon bag. Once the sampling point was sufficiently purged, a soil-vapor sample was extracted by connecting the Tygon tubing to a regulator which, in turn, was attached to a six-liter Summa canister. The regulator was set to produce a sample collection rate of 0.1 liter per minute. In addition to the nine soil-vapor samples collected from beneath the building, one ambient air sample, AA-1, was collected from outside the building (figure 2). The samples were submitted to York Analytical Laboratories, Inc. (York) in Stamford, Connecticut for analysis of VOCs by EPA Method TO-15. York is a NYSDOH ELAP (Environmental Laboratory Approved Program) certified laboratory that is qualified to perform this analytical method. The laboratory report and Chain-of-Custody form are presented in Appendix I.

RESULTS

The laboratory analytical results for the soil-vapor samples, which are summarized on table 1, confirm the conclusion presented in the November 2002 ESI that a possible source of VOCs exists beneath the southwestern portion of the MRC building. Two parent products, tetrachloroethylene (PCE) and 1,1,1-trichloroethane (TCA) were identified during the sampling. As shown on table 1, numerous breakdown constituents of these VOCs were detected. The sample results indicate that a possible source area of PCE is located near soil-vapor point SV-2; whereas a possible source area of TCA is located near soil-vapor point SV-6.

Soil-vapor point SV-9 is located approximately 35 feet away from SV-2 (possible source area of PCE); however no PCE was identified above the laboratory detection limits in this sample. Relatively high concentrations of cis-1,2-dichloroethylene (cis-1,2-DCE) were identified at soil-vapor point SV-9. Cis-1,2-DCE is a breakdown constituent of PCE. The relatively high concentrations of cis-1,2-DCE and absence of PCE in sample SV-9 would indicate this point is likely on the fringe of the PCE release area and not the result of vapor migration. The anaerobic conditions of the underlying materials aid in the substantial degradation of VOCs observed in the site ground water. Considering the parent VOC PCE was only detected at soil-vapor point SV-2, it is reasonable to conclude that there is minimal lateral migration of VOC in the soil vapor.

Aromatic VOCs and methylene chloride were detected in the ambient air sample. The detection of methylene chloride was also detected in the method blank. Methylene chloride was also identified in all of the soil-vapor samples; however, because of the method blank detection, it is not likely indicative if the vapor quality beneath the site building.

PRODUCT INVENTORY

In addition to the SVI described above, the NYSDEC also requested that LBG conduct a survey of all chemicals, including solvents, currently used or stored at the site. LBG and Sony has requested an inventory of such products from Praxair Corporation (Praxair). To date, Praxair has not responded to this request. When the information is received, LBG will forward it to the

May 6, 2004

NYSDEC in the form of an addendum. It is LBG's understanding that no halogenated solvents are currently used at the site.

If you have any questions or comments please feel free to contact me.

Very truly yours,

LEGGETTE, BRASHEARS & GRAHAM, INC.

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on 12/31/03. The project was identified as your project "Sony-Orangetown, NY".

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the NELAC acceptance requirements for environmental samples except those indicated under the Notes section of this report.

All the analyses met the method and laboratory standard operating procedure requirements except as indicated under the Notes section of this report, or as indicated by any data flags, the meaning of which is explained in the attachment to this report, if applicable.

The results of the analyses, which are all reported on an as-received basis unless otherwise noted, are summarized in the following table(s).

Units Key: For Waters/Liquids: mg/L = ppm ; ug/L = ppb For Soils/Solids: mg/kg = ppm ; ug/kg = ppb

Notes for York Project No. 03120838

1. The MDL (Minimum Detectable Limit) reported is adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All samples were received in proper condition for analysis with proper documentation.
6. All analyses conducted met method or Laboratory SOP requirements.
7. It is noted that no analyses reported herein were subcontracted to another laboratory.

Approved By:

Robert Q. Bradley
Managing Director

Date: 1/14/2004
