Re: Indoor Air and Groundwater Survey  
29-31 North Main Street  
Port Chester, NY 10573  
Tax Map Number: 142.31-1-16

Dear Ms. Clemenza,

Advanced Cleanup Technologies (ACT) performed an Indoor Air and Groundwater Survey at the above referenced property (the subject property) on September 20, 2016. The purpose for the survey was to determine whether Tetrachloroethene (PCE) had impacted air inside or groundwater beneath the subject property.

### Previous Investigations

ACT completed a Phase I Environmental Site Assessment (ESA) on July 25, 2016. The Phase I ESA indicated that the subject property had been historically used as a dry cleaning facility. ACT concluded that the historical dry cleaning operations and potential vapor encroachment conditions at the subject property are recognized environmental conditions.

ACT completed a Tier II Vapor Encroachment (VE) Screen on August 30, 2016. The VE Screen included the collection and analysis of two soil vapor samples (SS-1 and SS-2) outside the northern exterior wall of the building. Soil vapor samples could not be collected beneath the basement or crawlspace due to an extremely shallow water table. Soil vapor sample SS-1 was found to contain 250 µg/m<sup>3</sup> of PCE, which is above its NYSDOH soil vapor screening level of 100 µg/m<sup>3</sup>.

ACT concluded that a vapor encroachment condition exists at the subject property and recommended the collection and analysis of indoor air and ground water samples to determine whether soil vapor intrusion was taking place and whether groundwater had been impacted.

### Indoor Air Sampling

On September 20, 2016, two indoor air samples (IA-1 and IA-2) and one crawl space air sample (CS-1) were collected at the locations depicted in Figure 1. Sampling was performed in general conformity with "Guidance for Evaluating Soil Vapor Intrusion in the State of New York," October 2006 (NYSDOH Guidance). Field notes generated during the sampling event are enclosed.

The indoor air samples were collected by placing the sampling containers on a table approximately 3 feet above the floor. The crawl space sample was collected by placing the sampling container on the boiler pad in the crawl space. A 6-Liter stainless steel Summa canister with a flow regulator set to a flow rate of approximately 0.004 liters per minute was opened to initiate sampling. Sampling continued for approximately 24 hours until the canisters were almost full and the regulator was closed.

The indoor air and crawl space samples were transmitted under chain of custody to York Analytical Laboratories, Inc. (NYSDOH #10854). The samples were analyzed for VOCs in accordance with USEPA Method TO-15. Copies of the laboratory reports are also enclosed.

### Indoor Air Analysis

Table 1 provided below summarizes the concentrations of chlorinated VOCs detected in the indoor air samples as compared to indoor air guidelines contained in Table 3.1 of the NYSDOH Guidance. Soil vapor samples collected and analyzed during the previous investigation were also included along with Matrix 1 and Matrix 2 screening levels.

It can be seen from Table 1 that PCE was detected in indoor air samples IA-1 and IA-2 at  $1.2 \mu\text{g}/\text{m}^3$  and  $9 \mu\text{g}/\text{m}^3$  respectively, which are well below its NYSDOH indoor air guideline of  $30 \mu\text{g}/\text{m}^3$ . PCE was also detected in crawl space air sample CS-1 at  $12 \mu\text{g}/\text{m}^3$ , which is below the NYSDOH indoor air guideline. A comparison of the indoor air samples with the soil vapor samples indicates that PCE in soil vapor is not impacting air quality inside the building.

It can also be seen from Table 1 that Trichloroethylene (TCE) was detected in indoor air sample IA-2 at  $6.9 \mu\text{g}/\text{m}^3$ , which is above its NYSDOH indoor air guideline of  $2 \mu\text{g}/\text{m}^3$ . TCE was also detected in indoor air sample IA-1 at  $0.55 \mu\text{g}/\text{m}^3$  and in crawl space sample CS-1 at  $0.53 \mu\text{g}/\text{m}^3$ , which are well below its NYSDOH indoor air guideline. It can also be seen from Table 1 that TCE was not detected in soil vapor beneath the site. TCE in indoor air appears to be the result of solvents or cleaning products used inside the building and not soil vapor intrusion. Air samples collected in the basement of a building is considered a conservative analysis of indoor air quality. The low concentration of TCE in basement air sample IA-2 indicates that air quality in upper floors should be lower than indoor air guidelines.

October 5, 2016  
Desiree Clemenza  
Signature Bank

The low levels of other VOCs in indoor air are consistent with background concentrations in the metropolitan area and also not the result of vapor intrusion.

<sup>3</sup> Table 3.1, NYSDOH "Final Guidance for Evaluating Soil Vapor Intrusion in the State of New York" (October 2006)

## Groundwater Quality

Groundwater was encountered only a few inches beneath the basement slab. Three groundwater samples were collected from TW-1, TW-2, and TW-3 in the basement and crawl space at the locations depicted in Figure 1. The groundwater samples were collected using a 1" drill bit, a soil vapor probe, and a water pump with dedicated tubing.

The groundwater samples were transferred into laboratory-supplied sampling containers, refrigerated in a cooler, and transmitted under chain of custody to York Analytical Laboratories, Inc. The groundwater samples were analyzed for VOCs in accordance with EPA Method 8260.

It can be seen from Table 2 that no VOCs were detected in the groundwater samples from TW-1, TW-2, or TW-3.

### **Conclusions**

The results of the Indoor Air and Groundwater Survey are contained in this report. Based upon this survey, ACT makes the following conclusions concerning the environmental quality of the subject property:

- No soil vapor intrusion is occurring at the subject property;
- No groundwater impacts were detected at the subject property;
- There is no need for further investigation at the subject property.

Very truly yours,

## EXCLUSIONS AND DISCLAIMER

The purpose of this investigation was to assess the potential environmental liabilities at the subject site with respect to data, which Advanced Cleanup Technologies, Inc. has accumulated during the Phase II Environmental Site Assessment. The conclusions presented in this report are based solely on the observations of the site at the time of the investigation. Data provided, including information provided by others, was utilized in assessing the site conditions. The accuracy of this report is subject to the accuracy of the information provided. Advanced Cleanup Technologies, Inc. is not responsible for areas not seen or information not collected. This report is given without a warranty or guarantee of any kind, expressed or implied. Advanced Cleanup Technologies, Inc. assumes no responsibility for losses associated with the use of this report.

Aberdroth Ave  
Leakes Sample Notes:

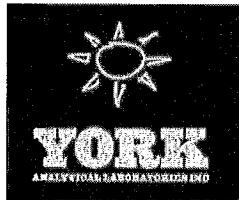

Sampler collected w/ 1" drill bit using soil vapor probe and water pump w/ dedicated tubing.

Samplers TW1 + TW2 had powerful sulfur odor from drill holes, TW3 had a moth ball odor that was different & distinct from the full basement odors. But the water in TW1 leaked out of the hole and did not decrease during pumping.

Other observations: water samples had an algal/organic "fluffy" looking sediment, possibly indicative of sewage/waste water not treated water.

## Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on September 22, 2016 and listed below. The project was identified as your project: **9015-PCNY**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Notes section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the attachment to this report, and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

York Sample ID	Client Sample ID	Matrix	Date Collected	Date Received

## General Notes for York Project (SDG) No.: 16I0810

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All samples were received in proper condition for analysis with proper documentation, unless otherwise noted.
6. All analyses conducted met method or Laboratory SOP requirements. See the Qualifiers and/or Narrative sections for further information.
7. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
8. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.

## Notes and Definitions

- QR-01 Analyses are not controlled on RPD values from sample concentrations less than 10 times the reporting limit. QC batch accepted based on LCS and/or LCSD QC results.
- QL-02 This LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.
- CCV-A The value reported is ESTIMATED. The value is estimated due to its behavior during continuing calibration verification (>30% Difference for average Rf). This applies to dectected analytes only.
- B Analyte is found in the associated analysis batch blank. For volatiles, methylene chloride and acetone are common lab contaminants.

*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence. This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
Non-Dir.	Non-dir. flag (Non-Directional Bias ) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

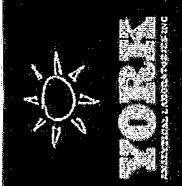

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.

## Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on September 22, 2016 and listed below. The project was identified as your project: **9015-PCNY**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Notes section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the attachment to this report, and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

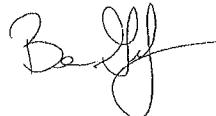

Please contact Client Services at 203.325.1371 with any questions regarding this report.

## General Notes for York Project (SDG) No.: 16I0811

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All samples were received in proper condition for analysis with proper documentation, unless otherwise noted.
6. All analyses conducted met method or Laboratory SOP requirements. See the Qualifiers and/or Narrative sections for further information.
7. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
8. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.

16I0811-02	TW-2	40mL Clear Vial (pre-pres.) HCl; Cool to 4° C
16I0811-03	TW-3	40mL Clear Vial (pre-pres.) HCl; Cool to 4° C

## Notes and Definitions

- QL-02 This LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.
- J Detected below the Reporting Limit but greater than or equal to the Method Detection Limit (MDL/LOD) or in the case of a TIC, the result is an estimated concentration.
- CCV-E The value reported is ESTIMATED. The value is estimated due to its behavior during continuing calibration verification (>20% Difference for average Rf or >20% Drift for quadratic fit).

*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence. This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
Non-Dir.	Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.
If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.	
If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.	
2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.	
Certification for pH is no longer offered by NYDOH ELAP.	
Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.	
For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.
