"CALLER SAID THAT THEY HAD A LEAK IN THEIR HEAT EXCHANGER SYSTEM WHICH CAUSED ABOUT 160 GAL OF GEAR OIL TO ENTER THEIR CHILLER PIT, THEN INTO AN OIL/WATER SEPARATOR, THEN INTO A DAM, THEN INTO A POND, THEN A SLIGHT SHEEN IN THEIR OUTFALL IN THE RIVER."

**DEC Remark:**

"Prior to Sept, 2004 data translation this spill Lead\_DEC Field was RJJ 12/14/2001: DAN PARSHALL, DUNLOP TIRE, TELECON RJJ SAID THAT ABOUT 160 GAL OF GEAR OIL SPILLED IN THEIR INCLOSED HEAT EXCHANGER SYSTEM, WHICH THEN WENT INTO A CHILLER PIT, THEN INTO AN OIL/WATER SEPARATOR, THEN INTO A DAM, THEN INTO ANOTHER OIL/WATER SEPARATOR, THEN INTO THEIR POND... DAN PLACED BOOMS AND ABSORBANT PADS IN THE POND AND IN THE OUTFALL AREA, AND HIRED CHOPPRA-LEE TO COME AND TAKE WATER SAMPLES... HE SAID THAT MOST OF THE GEAR OIL STAYED IN THE 2 OIL/WATER SEPARATORS, BUT A SLIGHT SHEEN WAS NOTICED IN THE POND, BUT IT DID NOT REACH THE OUTFALL IN THE RIVER... DAN WILL SEND ME HIS AND CHOPPRA-LEE'S REPORT AND KEEP ME INFORMED. 12/14/2001: RJJ/BFG AT SITE AT 1400... MEET WITH DAN PARSHALL, HE SHOWN US THE PROBLEM AND EXACTLY WHERE THE GEAR OIL LEAKED TO... MOST OF THE GEAR OIL WAS CAPTURED IN THEIR 2-OIL/WATER SEPARATORS, BUT A SLIGHT SHEEN WAS NOTICED IN THEIR RETENTION POND... THEY PLACED ABSORBANTS AND BOOMS IN THE DAM AND IN THE POND... NONE OF THE OIL REACHED THE OUTFALL TO THE NIAGARA RIVER. 12/19/2001: RECEIVED THE ANALYTICAL RESULTS FROM THE WATER SAMPLES TAKEN AT THEIR OUTFALL, FROM DAN PARSHALL... ALL THE RESULTS ARE NON-DETECT FOR OIL/GREASE... DAN ALSO SENT ME HIS INTERNAL REPORT ON THIS SPILL. 4/5/2002: RECEIVED THE DISPOSAL RECEIPTS FOR ALL THE ABSORBANT PADS, BOOMS AND GEAR OIL TAKEN TO MODERN LANDFILL... THE SPILL HAS BEEN CLEANED UP AND PROPERLY DISPOSED OF... NO FURTHER ACTION NEEDED... SPILL CLOSED OUT."

**DEC Remark:**

"Prior to Sept, 2004 data translation this spill Lead\_DEC Field was MJS 10/23/97: MJS TELECON WITH DAN DUVALL(DUPONT). DISCOVERED TWO UST'S. FIRST IS NOW UNCOVERED AND IS APPROX 10K GALLONS. TANK PARTIALLY FILLED WITH GRAVEL AND CLAY. THEY PLAN TO CLOSE TANKS IN PLACE - REVIEWED SAMPLING REQUIREMENTS. THEY HAVE RETAINED MARCOR TO PERFORM WORK. MJS RECEIVED MESSAGE THAT DUPONT NOW PLANS TO REMOVE TANKS INSTEAD OF CLOSE IN PLACE. THEY WILL CONTACT ME NEXT WEEK FOR INSPECTION OF EXCAVATION. 10/27/97: MJS TELECON WITH MR DUVALL. TANKS REMOVED. SAMPLES SUBMITTED TO LAB. MJS TO MEET ON SITE TODAY AT 1030 HRS. 1030 HRS - SITE MEETING WITH DAN DUVALL, JEFF MEISSNER(DUPONT), JEFF DOSSER, BO BURGHARDT(MORRISON KNUDSEN CORP), AND KEVIN THOMPSON(MARCOR). SAMPLES DUE LATER TODAY OR EARLY TOMORROW. CONTAMINATED SOIL STOCKPILED ON POLY AND COVERED. EXCAVATION IS RED, TIGHT CLAY. NO VISUAL CONTAMINATION. HIGH-TENSION TOWER AT CORNER OF EXCAVATION IS A SAFETY CONCERN(WANT TO BACKFILL ASAP). MJS ALLOWED THEM TO BACKFILL THAT CORNER FOR SAFETY PURPOSES. THEY WILL FAX SAMPLE RESULTS WHEN RECEIVED. 1500 HRS - MJS RECEIVED MESSAGE THAT ALL PARAMETERS NON-DETECT FOR ALL SAMPLES. THEY WILL FAX RESULTS. MJS LEFT MESSAGE FOR DAN DUVALL THAT EXCAVATION CAN BE BACKFILLED BASED ON SAMPLE RESULTS. 10/29/97: RECEIVED FAX OF SAMPLE RESULTS FOR SOIL PILE, WASTEWATER, AND EXCAVATION. ALL PARAMETERS NON-DETECT. 12/03/97: MJS TELECON TO MR DUVALL AND LEFT MESSAGE FOR HIM TO CALL REGARDING CLOSURE REPORT. 12/04/97: MJS TELECON FROM MARK AT DUPONT. HE STATED THAT MR DUVALL IS OUT UNTIL 12/15. MARCOR IS PREPARING A REPORT AND HE WILL FORWARD COPY WHEN RECEIVED. 02/06/98: RECEIVED REPORT FROM DUPONT. NON-HAZ MANIFESTS FOR SOIL NOT SIGNED BY DISPOSAL FACILITY. MJS TELECON WITH DAN DUVALL. HE WILL OBTAIN INVOICE OR WEIGH SLIPS AND FORWARD. 02/18/97: RECEIVED SIGNED WASTE MANIFESTS AND WEIGH SLIPS FROM MR DUVALL. NO FURTHER ACTION REQUIRED. MJS CLOSE FILE. 03/27/98: MJS TELECON FROM MR DUVALL REQUESTING CLOSURE LETTER. MJS DRAFTED CLOSURE LETTER."

<b>Site Class Desc (GIS):</b>	No Further Action at this Time: Sites are given a classification of "N" when:					

a. the investigation and evaluation of a Class P site results in a determination that contamination at the site does not warrant placing the site on the Registry or it is being addressed under a brownfield program;

b. a site was in a brownfield program (BCP, ERP or VCP) or other non-Registry program, remediation was not completed, and the site did not otherwise qualify for listing on the Registry. As an example, this occurs when a volunteer begins a brownfield project and then for economic or other reasons, determines they cannot complete the work and the brownfield project is terminated. If the contamination at the brownfield site qualifies it for placement on the Registry, the Department acts to do so. If the site re-enters a brownfield program, it can be reclassified to Class A (active) to indicate that work has recommenced;

c. a site was identified simply as the location(s) where a drum(s) or other discrete waste was at one time present and subsequently removed by DEC or others and, based on the resulting conditions, no need for additional work was apparent; or

d. an application to the BCP, ERP or VCP was submitted, and was then withdrawn or terminated before any actions were taken to investigate or remediate the site.

Access to the plant is limited to plant employees. Groundwater samples have shown low-level metal contamination. Exposures via drinking water are not expected because there are no known private drinking water wells in this area which is served by public water. There are numerous industrial wells in the area which are not used for potable purposes. The potential for human exposure to contaminants from this site is minimal. Continued monitoring of groundwater is recommended.

**Source of Data:**

Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e., State Superfund, Brownfield Cleanp, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are include in this database. The Database also includes the "Registry of Institutional and Engineering Controls in New York State". Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

**Description:**

The DuPont Yerkes Plant is located on River Road, southeast of New York State Thruway Route 190, in the Town of Tonawanda, Erie County, New York. The Plant site consists of approximately 90 acres and is located in a highly industrialized section of Tonawanda. The site itself consists of 30 acres where waste was disposed. The site is bounded on the northeast by Kenmore Avenue, on the northwest by properties owned by Trans American Properties Inc. and the New York State Thruway Authority, on the southwest by River Road and on the southeast by property owned by General Motors Corporation. DuPont has reported disposal during a period from 1921 to 1978 of just over 91,400 tons of general waste and product waste in eight landfill areas at the Yerkes Plant Site. The locations of the landfill areas are at the east end of the property. In addition, lesser quantities of wastes (including laboratory waste) from the Plant Research and Development Department were land filled at the two other locations. A majority of the waste was disposed of in an extensive topographic low area (Unit 8) and in six pits (12- to 30-feet-deep) in the northeastern portion of the Site (Units 1,3,4,5, 6 and 7). Waste Corion, Tedlar, Vexar, Rayon, cellophane, polyvinyl alcohol film, paint and laboratory chemicals were disposed in ten pits, each 15-20 feet deep. These pits were then back-filled with foundry sand. Monitoring wells have been installed around the site. Samples by DuPont indicate that concentrations of sulfate, chloride, barium, lead, and mercury exceeded N.Y.S. DEC groundwater standards. Groundwater samples collected in 1982 by the USGS did not indicate any organic priority pollutants, although 30 non-priority pollutants were detected. Soil samples collected by NUS in 1984 contained polynuclear aromatic hydrocarbons (PAHs), methylene chloride, and several phthalates. Groundwater samples contained phenols, PAHs, pesticides and benzene. A Phase I Investigation was completed in 1990. In early 1994 DuPont completed a Phase II Investigation at this site. Only one of the ten disposal pits was found to contain elevated contaminant levels. Following additional groundwater sampling to assess this pit, DuPont submitted a petition to delist this site. This petition was accepted by the Department and the site was delisted from the Registry on 05/06/1996.

**Assessment:**

No environmental impacts are associated with this site so it has been delisted from the Registry.

<b>Site Class Desc (GIS):</b>	Complete: The classification used for sites where the Department has determined that remediation has been satisfactorily completed under a remedial program (i. e., State Superfund, Brownfield Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program, and RCRA Corrective Action Program). State Superfund (Registry) sites must have completed all active operation, maintenance, or monitoring requirements before they can be delisted and made class C. Non-registry sites may be made a class C after successful completion of all required construction or after a no further action remedy has been selected by the Department. These sites will be issued a Certificate of Completion (COC), but may still require ongoing maintenance and periodic certification of institutional/engineering controls (IC/ECs).					
<b>Site Class Desc:</b>	RCRA					
<b>Program:</b>	Resource Conservation and Recovery					
<b>Program Desc:</b>	The site is located in a commercial/industrial/residential area of Tonawanda served by public water. Exposures via drinking water are not expected. A housing development borders the facility on the north. The disposal area is completely surrounded by a fence and access to the site is controlled at all times. In 1995, PCB-contaminated soils were excavated and disposed off-site. The area was then backfilled and covered. These actions reduced the potential for human exposure to acceptable levels.

The Database also includes the "Registry of Institutional and Engineering Controls in New York State". <b>Description:</b>	<p>Location: The FMC facility is located in a industrial area of the Town of Tonawanda at the corner of River Road and Sawyer Avenue. Site Features: Records indicated that from 1964 to 1976 the firm disposed of some 100 tons of off-specification persulfates, perborates and peroxides in pits immediately southwest of the plant area. After cessation of this disposal activity, the pits were covered and graded. Portions of the pits are on land transferred to the Niagara Mohawk Corporation. The size of each pit was estimated to be 20 ft. x 20 ft. x 10 ft. History: A Phase I Investigation Report was completed in 1990 and a Preliminary Site Assessment (PSA) by FMC was been completed in 1995. In addition to the off-specification compounds, elevated levels of PCBs were also encountered in two of the disposal pits. As a result of the findings of the PSA, the Company completed a Interim Remedial Measure (IRM) to excavate and dispose of the contamination off-ste at a permitted disposal facility. This work was completed in 1995 with the removal of 285 cy of waste. A Record of Decision was issued in March of 1997 that determined that all hazardous wastes, including the PCBs, have been removed from the disposal area and that no further action was necessary. This site was removed from the Registry in June 1996.</p>					
<b>Assessment:</b>	Waste disposal pits have been properly remediated. A work plan for the PCB removal was prepared by FMC and the IRM was completed in October 1995. Sampling conducted as part of the IRM confirmed the removal of PCB to clean up levels of less than 10 ppm for subsurface and less then 1 ppm for surface soils. Incidental to the PCB removal was the excavation and off site disposal of the elevated levels of VOCs and metals found during the PSA. Significant environmental threats have been eliminated.

<b>Describe the Site:</b>		Four covered waste pits were used as dumps for chemical wastes of FMC Corp. Approximately 100 tons of chemicals have been dumped over a period of 12 years.				
<b>Describe the Threat:</b>						
<p>Although the compounds disposed of in the pits will eventually decompose into harmless salts, the close proximity of the Niagara River and its exclusive use as a drinking water source renders this site potentially hazardous to the population and the environment. Several of the compounds listed are explosive at elevated temperatures and/or when in contact with organic materials.</p>

**Site Name (GIS):** 3M O-Cel-O Sponge Plant  
**Site Class Desc (GIS):** This classification is assigned to a site that has been properly closed but that requires continued site management consisting of operation, maintenance and/or monitoring. Class 4 is appropriate for a site where remedial construction actions have been completed for all operable units, but the site has not necessarily been brought into compliance with standards, criteria, or guidance (e.g., a groundwater extraction and treatment system has been installed and is operating properly but groundwater standards have not been achieved yet). The Record of Decision should define the remedial action objectives that need to be achieved during site management. If a Certificate of Completion (CoC) is to be issued for a site, the CoC is issued concurrently with the reclassification.

**Program:** HW  
**Program Desc:** State Superfund Program  
**Assess DOH:** Exposures by direct contact or inhalation are not expected because public access is restricted at this active facility and the remaining contamination is well below the ground surface. Exposures via drinking water are not expected because the area is served by public water.

**Source of Data:** Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e., State Superfund, Brownfield Cleanp, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are include in this database. The Database also includes the "Registry of Institutional and Engineering Controls in New York State". Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

**Description:**

Location: The 19 acre O-Cel-0 Sponge Facility is owned by the 3M Corporation and is located at 305 Sawyer Avenue in a heavily developed industrial area of the Town of Tonawanda. Site Features: The facility is bounded by Sawyer Avenue and a mix of industrial and residential properties to the north, the Dunlop Tire Corporation to the south, an industrial property to the east, and an industrial facility to the west. The topography of the site is relatively flat. The Registry site consists of less than 1 acre and includes the former Carbon disulfide (CS2) Storage tank and former drainage swale at the rear of the facility. The Niagara River is located approximately 1 mile west of the facility. Current Zoning/Use(s): This site is currently in operation and is zoned for industrial manufacturing and processing. Historical Use(s): The Facility uses CS2 in the manufacture of cellulose sponges. From the early 1960s through late 1995, CS2 was stored in a 19, 000-gallon steel tank located on the southeastern portion of the Facility. An earthen berm surrounded the tank prior to the installation of a five-foot high concrete containment structure in the early 1970s. Historically, the CS2 storage tank was loaded directly from railroad tank cars by displacing the CS2 in the tank car with water. Upon completion of the transfer, water within the tank car was discharged to the diked containment area. Similarly, water that was displaced from the storage tank as it filled was also discharged to the containment area. In the past, a control structure (weir) in the containment area allowed any overflow to discharge into an adjacent drainage swale. Operational modifications were subsequently implemented by the Facility to prevent discharges of water containing CS2 to the swale. A permitted aeration process was also constructed within the containment dike to reduce the concentration of CS2 in the water within the diked area. This water was then discharged directly to the Tonawanda Publicly Owned Treatment Works (POTW) in accordance with applicable limits in the Facility's permit. In 1995, the storage tank was decommissioned and the drainage swale was upgraded. A report entitled "Report on the Site Assessment and Risk Characterization Study, March 1998" (RI Report) summarizes the results of the investigations. Site Geology and Hydrogeology: Four distinct stratigraphic units exist at the facility. Fill consisting primarily of gravel and disturbed silty clay is present at a depth of approximately 0 to 5 feet. A Glaciolacustrine silty clay deposit exists below the fill. It has a very low permeability (meaning the groundwater cannot easily move through it) and an approximate thickness of 62 feet. Below the clay deposit, is a dense glacial till approximately 6 feet thick that is composed of poorly sorted gravely sand and clay. The permeability of this unit is also very low. Shale bedrock of the Camillus Shale Formation was encountered at depths ranging from 69 to 71 feet. The unconsolidated geologic deposits at the facility are underlain by the Camillus Shale Formation, which is part of a regional aquifer in the Erie-Niagara Basin. Groundwater from this bedrock aquifer, however, is not utilized as a source of drinking water in the Tonawanda area because of naturally occurring high mineral content and the close proximity to the Niagara River, an important source of municipal drinking water throughout the western New York area. Groundwater flow in the upper bedrock unit at the 3M Tonawanda site is to the west toward the Niagara River. Site Management: Long-term maintenance of the drainage swale and associated catch basins are completed as needed. Upper bedrock groundwater is sampled semi-annually, while overburden groundwater is sampled annually. Groundwater monitoring indicates that the remedy remains protective of public health and the environment.

**Assessment:**

Nature and Extent of Contamination: Prior to Remediation: During routine transfers from railroad tank cars to a former above ground storage tank, carbon disulfide was spilled into a drainage swale and leached into the surrounding soils. Carbon disulfide in these soils was first observed in the fall of

Map Key	Number of Records	Direction	Distance (mi/ft)	Elev/Diff (ft)	Site	DB
---------	-------------------	-----------	------------------	----------------	------	----

1988 during the repair of the concrete dike surrounding the storage tank. These repairs involved chipping spalled concrete with pneumatic jackhammers to establish sound areas where new cement grout could be placed. During this jackhammering, ignition of the carbon disulfide materials was noted. Post-Remediation: The RI/FS and IRM activities have been completed. Based upon the success of the IRMs, the RI concluded that the IRMs have adequately addressed the significant threat originally posed by hazardous waste at the site. 3M constructed a new state-of-the-art CS2 storage facility designed to prevent future releases of CS2 to the environment. The location of this new storage facility is approximately 150 feet southwest of the former CS2 storage tank. The system became operational in late winter 1995 and is registered with the NYSDEC through the Chemical Bulk Storage Program. A No Further Action ROD was executed for this site in March 1999. Long-term groundwater monitoring and maintenance of the IRMs began in 2001 and are ongoing. The groundwater results indicate that the remedy remains protective of public health and the environment.

<b>Site Class Desc (GIS):</b>	No Further Action at this Time: Sites are given a classification of "N" when:		

- a. the investigation and evaluation of a Class P site results in a determination that contamination at the site does not warrant placing the site on the Registry or it is being addressed under a brownfield program;
- b. a site was in a brownfield program (BCP, ERP or VCP) or other non-Registry program, remediation was not completed, and the site did not otherwise qualify for listing on the Registry. As an example, this occurs when a volunteer begins a brownfield project and then for economic or other reasons, determines they cannot complete the work and the brownfield project is terminated. If the contamination at the brownfield site qualifies it for placement on the Registry, the Department acts to do so. If the site re-enters a brownfield program, it can be reclassified to Class A (active) to indicate that work has recommenced;
- c. a site was identified simply as the location(s) where a drum(s) or other discrete waste was at one time present and subsequently removed by DEC or others and, based on the resulting conditions, no need for additional work was apparent; or
- d. an application to the BCP, ERP or VCP was submitted, and was then withdrawn or terminated before any actions were taken to investigate or remediate the site.

**Description:**

Lagoon for settling elemental sulfur. Excess liquid pumped to Tonawanda sanitary sewer system. Sulfur removed in Sept. 1983 to approved off-site sanitary landfill and lagoon to be filled with earth and conc rete. Sulfur now being dewatered on vacuum filter and removed to off-site disposal area. A Phase I investigation has been completed for this site.

**Assessment:**

Site was not found to contain any hazardous wastes.

**Describe the Site:**

The site is a massive fenced plant located close to the Niagara River. There may be many small plants within the large plant. There is a 15-acre landfill north of plant #4, although the exact location is not known. The material allegedly landfilled is a cellulose material.

**Describe the Threat:**

Some cellulose compounds are toxic and explosive. Since cellulose of unknown composition was landfilled on-site, a potential hazard may exist.

**Site Name:** Allied Chemical - Special Chemical Div.  
**Site Name (GIS):** Allied Chemical - Special Chemical Div.  
**Site Class Desc (GIS):** Complete: The classification used for sites where the Department has determined that remediation has been satisfactorily completed under a remedial program (i. e., State Superfund, Brownfield Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program, and RCRA Corrective Action Program). State Superfund (Registry) sites must have completed all active operation, maintenance, or monitoring requirements before they can be delisted and made class C. Non-registry sites may be made a class C after successful completion of all required construction or after a no further action remedy has been selected by the Department. These sites will be issued a Certificate of Completion (COC), but may still require ongoing maintenance and periodic certification of institutional/engineering controls (IC/ECs).

**Site Class Desc:**  
**Program:** HW  
**Program Desc:** State Superfund Program  
**Assess DOH:** This site is located in an industrial area with no homes in the immediate vicinity. Access to the site is secured by a fence. The disposal area has been covered with clean soil thereby minimizing the potential for direct contact. On-site monitoring wells have shown contamination of PAHs, volatile organics and metals. However, similar contaminants have been detected in the Tonawanda Coke well which is up-gradient to this site. Contaminated groundwater is likely to migrate into the Niagara River which is used as a source of public drinking water. Industrial wells are prevalent in the area, while public water is available. No known private wells exist in the immediate area.

**Source of Data:** Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e., State Superfund, Brownfield Cleanp, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are include in this database. The Database also includes the "Registry of Institutional and Engineering Controls in New York State". Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

**Description:**

Location: The disposal pit was located within the former Allied Chemical facility at 3821 River Road in Tonawanda, in an industrialized area of the Town Of Tonawanda, Erie County. The pit was located between the main facility buildings and River Road. Site Features: The site consists of a disposal pit

used to dispose of R&D waste from the former chemical manufacturing facility. Current Zoning/Use(s): The former Allied Chemical site is currently zoned for commercial use as a storage, warehouse, and distribution facility. Historic Use: This Allied Chemical - Special Chemical Division Site was a former disposal pit used during the 1950s and 1960s for the disposal of spent catalyst containing chromium compounds, polyethylene, and chlorinated polyethylene. The pit was approximately 40 feet in diameter and was located on the southwest portion of the former Allied property near River Road. Geology/Hydrogeology: Surficial geology at the Allied Chemical site is characterized by a dense, massive, reddish glaciolacustrine clay overlain by fill material, clay, sand, and gravel. As expected the flow direction of site groundwater follows the dip of the clay surface to the southwest towards the Niagara River.

**Assessment:**
