"cleanup pending - done by optech - from 230 KV Cable System (under retirement)"

**DEC Remark:**

"7/26/16:SAC TELECON LISA MONTESANO - NATIONAL GRID. MS. MONTESANO SAID THAT SOURCE OF SPILL WERE 6 CABLES. THERE IS A PROJECT WHERE THESE CABLE ARE BEING REMOVED. THESE CABLES WERE FILLED WITH OIL. SO PRIOR TO HAVING THEM REMOVED, THEY DRAINED THE OIL. AFTER DRAINING THE OIL, THEY CAPPED BOTH ENDS OF EACH CABLE. HOWEVER, THE CAPS DID NOT SEAL THE ENDS ENTIRELY LIKE THEY WERE SUPPOSED TO, AND SOME PRODUCT LEAKED FROM EACH OF THE 12 ENDS. THE PRODUCT LEAKED INTO THE CRUSHED STONE AND ON CONCRETE. MONTESANO ESTIMATED 10 GALLONS AT MOST SPILLED. OP-TECH ENVIRONMENTAL SERVICES (NRC) IS DOING THE CLEAN UP. ONCE THE SPILL HAS BEEN CLEANED UP, THEY WILL RE-CAP THE ENDS. AFTER CAPPING THE ENDS AGAIN, THEY WILL WRAP THE ENDS WITH BAGS SO IF THE CAPS LEAK AGAIN, THE OIL WILL BE TRAPPED IN THE BAGS. THE REMOVAL OF THE CABLES IS SCHEDULED FOR AUGUST 8TH. THE SPILL FILE WILL REMAIN OPEN AND ANY ADDITIONAL SPILLS THAT MAY OCCUR DURING THIS PROCESS, WILL FALL UNDER THIS SPILL FILE. 11/4/16:RECEIVED DISPOSAL RECEIPTS AND ANALYTICAL RESULTS. RESULTS FOR ALL SAMPLES WERE NON-DETECT FOR PCBs. NO FURTHER WORK IS REQUIRED."

"4/7/14:SAC TELECON JOE PIETRO - NRG. MR. PIETRO SAID OPERATOR WENT TO CLEAN OUT A STRAINER. WHEN HE OPENED LINE TO ACCESS STRAINER, FUEL SPILLED. ABSORBENTS WERE USED TO CLEAN UP THE SPILL. CONTAMINATED MATERIAL GENERATED AS A RESULT OF THE CLEAN UP ARE STORED ON-SITE IN A DRUM. 4/8/14:SAC INSPECT SITE. MET W/JOE PIETRO. SPILL OCCURRED BECAUSE THEY DECIDED TO HAVE AN OPERATOR CLEAN THE STRAINER ON THE ONE PUMP. THE SYSTEM WAS SHUT OFF AND THERE WAS NO PRODUCT IN THIS LINE. HOWEVER, THE OPERATOR DECIDED TO CLEAN THE STRAINER ON THE OTHER PUMP AND WHILE THE POWER ON THE PUMP WAS OFF, THAT LINE HAD PRODUCT IN IT AND THAT CAUSED THE SPILL. ABSORBENTS WERE USED TO CLEAN SPILL. AT THE TIME OF THE INSPECTION, ADDITIONAL PADS WERE PLACED DOWN AS A PRECAUTION BUT NO PRODUCT APPEARED TO HAVE BEEN ABSORBED. THERE WAS A DRAIN NEAR THE SPILL AREA BUT IT'S CONNECTED TO A COLLECTION AND WATER TREATMENT SYSTEM. MR. "1/23/14:SAC TELECON JOE PIETRO - NRG. SPILL WAS INSIDE CONTAINED AREA AND NEAR COAL PILE. THEY USED COAL PILE TO ABSORB PRODUCT FOR CLEAN UP AND THEN BURNED COAL. MR. PIETRO SAID AS PART FO THEIR TITLE V PERMIT, THEY WERE ALLOWED TO SPRAY WASTE OIL ONTO THE COAL PILE BEFORE BURNING IT. 1/24/14:SAC TELECON AL CARLACCI - DEC/DIV OF AIR. MR. OF DIESEL FUEL FROM AN OVERFILL OF THEIR BULLDOZER, OCCURED NEAR THEIR COAL PILE,IN A CONTAINED AREA...THEY THEN PUSHED THIS FUEL INTO THE NEARBY COAL PILE,WHICH ABSORBED IT,THEN WERE ABLE TO BURN THIS COAL IN THEIR FACILITY,PER THEIR PERMIT. 2/3/2014: RJJ AT SITE WITH JOE PIETRO AT 0900...JOE SHOWN ME WHERE/HOW THIS SPILL OCCURED...IT APPEARS THAT THE BULLDOZER RAN OVER THE DIESEL FUEL HOSE CAUSING ~30 GALS. OF FUEL TO LEAK OUT,WHILE FUELING THIS PIECE OF EQUIPMENT...THEIR COAL PILE IS ~100' NORTH OF THE FUELING STATION,SO THEY QUICKLY BULLDOZED THE AFFECTED AREA INTO THEIR COAL PILE,WHICH THEY THEN USE FOR THEIR FACILITIES HEATING...THE AREA HAS NO EVIDENCE OF ANY SPILLED FUEL...THE CLEAN-UP IS ACCEPTABLE. 2/4/14:SAC REVIEW FILE. "CALLER STATES THAT A SHEEN IS ON RIVER NEAR THE PLANT, AND THE COAST GUARD IS ON SCENE LOOKING THINGS OVER TO SEE WHERE IT IS COMING FROM: NOT SURE WHERE IT IS FROM"

**DEC Remark:**

"3/31/05:SAC inspect site. Mike Phelps - DEC Law Enforcement was on-site. Met w/Mike Cummings and Mike Masters - NRG. Booms in place at discharge. Slight sheen still emanating. However, per Officer Phelps, Mr. Cummings and Mr. Masters, this sheen is far less than was originally observed when it was first noticed. They inspected sewer line along River Road and Sawyer Avenue and did not observe any product or sheen. They followed the line until they reached a manhole in line with a building drain at the station where a sheen was noticed. They believe the source was an ID Fan that may have sprung a leak. Non-contact cooling water is involved with this fan and if the fan sprung a leak it dripped to this cooling water and discharged out the storm sewer. They shut down the fan and the amount of oil coming out of the discharge pipe decreased. The material coming from the discharge pipe had a purple color which is not like turbine oil. They will be checking the site glass on the fan for the oil level. The Coast Guard was at the site and will be following up. They took a sample of the contaminated water for analysis. 3/31/05:SAC called Erie Co. Emergency Services prior to leaving for inspection but message machine answered. Left message regarding spill. 4/1/05:SAC met w/Robert Smythe - DEC Div of Water. Mr. Smythe inspected site and met w/Mike Cummings and Mike Basil - NRG. Sheen still coming out of pipe but intermittently. They checked site glass and there was no discernible change in level. They will continue to monitor the site and send in a report to Mr. Smythe. Mr. Smythe will provide a copy for SAC for spills file. Mr. Smythe said the Coast Guard came to site as he was leaving. 6/6/05:Received copy of initial letter report from NRG to Robert Smythe. No further work required by Spills."

<b>Site Class Desc (GIS):</b>	No Further Action at this Time: Sites are given a classification of "N" when:		

- a. the investigation and evaluation of a Class P site results in a determination that contamination at the site does not warrant placing the site on the Registry or it is being addressed under a brownfield program;
- b. a site was in a brownfield program (BCP, ERP or VCP) or other non-Registry program, remediation was not completed, and the site did not otherwise qualify for listing on the Registry. As an example, this occurs when a volunteer begins a brownfield project and then for economic or other reasons, determines they cannot complete the work and the brownfield project is terminated. If the contamination at the brownfield site qualifies it for placement on the Registry, the Department acts to do so. If the site re-enters a brownfield program, it can be reclassified to Class A (active) to indicate that work has recommenced;
- c. a site was identified simply as the location(s) where a drum(s) or other discrete waste was at one time present and subsequently removed by DEC or others and, based on the resulting conditions, no need for additional work was apparent; or
- d. an application to the BCP, ERP or VCP was submitted, and was then withdrawn or terminated before any actions were taken to investigate or remediate the site.

**Source of Data:** Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e. , State Superfund, Brownfield Cleanp, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are include in this database. The Database also includes the "Registry of Institutional and Engineering Controls in New York State". Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

**Description:**

is a former resin manufacturing company where solvents, phenols, resin sludges and other toxic chemicals were stored on-site in drums, above-ground tanks and underground tanks. 500 drums were removed by 1982 for off-site disposal. An investigation completed in 1983 under a 1981 DEC Order on Consent indicated that phenol was entering the Niagara River via surface water and possibly contaminating groundwater. As a result, Polymer Applications completed the construction of a barrier wall and groundwater collection trench to reduce releases to the Niagara River. A disastrous fire on July 4-5, 1988 caused spillage of raw organic chemicals from above ground tanks, which produced extensive groundwater and surface water contamination. Contravention of groundwater standards were noted for aroclor-1260: 6.9 ppb, total xylenes: 31000 ppb, phenol: 290,000 ppb, and methylene chloride: 38,000 ppb. Surface water standards were contravened for methylene chloride: 21,000 ppb, aroclor-1260: 1500 ppb, total xylenes: 48,000 ppb, ethylbenzene: 5400 ppb and phenol: 120,000 ppb. A State funded Remedial Investigation/Feasibility Study (RI/FS) was completed in 1995 with the Record of Decision issued in March 1996. During the RI, a large number of drums were discovered and found to be stored haphazardly in two buildings on site. Some drums were leaking, and many chemical incompatibles were stored together. An emergency removal action by USEPA was initiated and completed in November 1996. During this action, drums were classified and stabilized, storage tanks were decontaminated, and all hazardous substances were sent off-site for proper disposal. A treatability study to evaluate bioremediation was completed during the spring and summer of 1997 and confirmed that the selected remedy would effectively degrade the site contaminants. The Remedial Design was completed in February 1999. Final site remediation utilizing the State Superfund program is planned for 2005.

**Assessment:**

Soils and groundwater are contaminated with phenols and other organics. The highest levels of contamination are found on-site in soils from 0 to 4 feet in depth and in shallow on-site groundwater.

<b>Site Class Desc:</b>			
<b>Site Class Desc (GIS):</b>	Complete: The classification used for sites where the Department has determined that remediation has been satisfactorily completed under a remedial program (i. e., State Superfund, Brownfield Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program, and RCRA Corrective Action Program). State Superfund (Registry) sites must have completed all active operation, maintenance, or monitoring requirements before they can be delisted and made class C. Non-registry sites may be made a class C after successful completion of all required construction or after a no further action remedy has been selected by the Department. These sites will be issued a Certificate of Completion (COC), but may still require ongoing maintenance and periodic certification of institutional/engineering controls (IC/ECs).		

**Source of Data:** Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e., State Superfund, Brownfield Cleanp, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are include in this database. The Database also includes the "Registry of Institutional and Engineering Controls in New York State". Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

**Assess DOH:** Measures are in place to manage soils at the site properly and to prevent contact and use of groundwater at the site. People are not drinking the contaminated groundwater because the area is served by a public water supply that is not affected by this contamination.

**Description:**

Location: The Polymer Applications site is located at 3445 River Road in the Town of Tonawanda, Erie County, New York. The site is approximately 0.3 miles north of the intersection of River Road and Sheridan Drive. Site Features: Several large buildings in various stages of decay were demolished and removed from the site by Erie County in 2013. The remediation area was located directly behind the structures on the east end of the site. The site is approximately 6.7 acres in size and is on the eastern side of River Road, directly across from the NRG Huntley Power Generation Station and is also adjacent to the Goodyear Dunlop Tire Corporation property. The nearest residential area is located approximately 1,000 feet to the north along Sawyer Avenue. The Niagara River is located approximately 1,000 feet to the west of the site. Several other listed hazardous waste sites are located within 1/4 mile of the Polymer site, including the O-Cell-O site (#915148) to the north, and the Dunlop site (#915018) to the east. Current Zoning/Uses: The site is zoned industrial and is located in a heavily industrialized area of the Town. Historical Use: The facility operated at the site from 1968 through 1988. Its activities included the manufacture of phenolic resins, phenol-formaldehyde resins, plastics, and various rubber products for use in automotive, paint, and coatings industry. Disposal practices at the site included the discharge of un-reacted phenols, phenolic resins, and light hydrocarbons into an on-site lagoon. Historical aerial photos also showed significant volumes of liquids within the former bermed storage tank areas. In addition, there have been several reports of spills from approximately 1977- 1988. In July 1988, a major fire severely damaged the process and tank farm areas of the site. An estimated 70,000 gallons of a phenol/solvent mixture were released during the fire. In 1995, a State funded Remedial Investigation and Feasibility Study (RI/FS) was completed. This investigation characterized the nature and extent of on-site and off-site contamination, and resulted in the March 1996 Record of Decision (ROD) for the site. An emergency removal action was also completed by the US Environmental Protection Agency (EPA) in November 1996. This removal action included the following activities: classification, stabilization, and disposal of a large number of drums of hazardous substances; the cleaning and decontamination of chemical storage tanks; and the removal and proper disposal of all remaining hazardous substances. Remedy construction began in 2005 and was completed in 2006. The soil bio-treatment cell was operated until January 2007 when it was shut down after sampling of the treatment cell soils indicated that there were no appreciable reductions in the contaminants of concern. A ROD Amendment was issued in December 2009 that revised the original remedy to include the excavation and off-site disposal of all residual contamination above commercial use guidance values. This remedy was completed in the Fall of 2011 and is the subject of the approved FER for the site. Site Geology/Hydrology: The site geology is comprised of up to 13 feet of various fill materials (sand, gravel, brick, foundry sand, wood, etc.) over a thick layer (up to 50 feet) of silty

clay. The clay is underlain by 5 to 12 feet of gravelly silt which overlies the Camillus Shale bedrock. The bedrock was found at depths between 50 and 67 feet below ground surface (bgs) in on-site borings. Water-bearing zones at the site occurred in the fill unit, the gravelly silt overlying bedrock, and the bedrock. Groundwater in the fill was perched on top of the underlying lower permeability silt unit. The depth to the perched groundwater in fill ranged from about 2 to 10 feet bgs across the site. Shallow and intermediate groundwater at the site flows to the west, and that the deep groundwater flows to the south and east. The thick silty clay layer has a low permeability, and therefore it greatly reduces the potential for contaminant migration into the deeper groundwater.

**Assessment:**

Remediation at the site is complete and long term site management is ongoing. Prior to remediation, the primary contaminants of concern were volatile organic chemicals and semi-volatile organic compounds in groundwater and soil.

**Site Name:** Polymer Applications  
**Site Name (GIS):** Polymer Applications  
**Site Class Desc (GIS):** Complete: The classification used for sites where the Department has determined that remediation has been satisfactorily completed under a remedial program (i. e., State Superfund, Brownfield Cleanup Program, Environmental Restoration Program, Voluntary Cleanup Program, and RCRA Corrective Action Program). State Superfund (Registry) sites must have completed all active operation, maintenance, or monitoring requirements before they can be delisted and made class C. Non-registry sites may be made a class C after successful completion of all required construction or after a no further action remedy has been selected by the Department. These sites will be issued a Certificate of Completion (COC), but may still require ongoing maintenance and periodic certification of institutional/engineering controls (IC/ECs).  
**Site Class Desc:** HW  
**Program:** State Superfund Program  
**Program Desc:** Measures are in place to manage soils at the site properly and to prevent contact and use of groundwater at the site. People are not drinking the contaminated groundwater because the area is served by a public water supply that is not affected by this contamination.  
**Assess DOH:** Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e., State Superfund, Brownfield Cleanp, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are include in this database. The Database also includes the "Registry of Institutional and Engineering Controls in New York State". Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

**Description:**

Location: The Polymer Applications site is located at 3445 River Road in the Town of Tonawanda, Erie County, New York. The site is approximately 0.3

miles north of the intersection of River Road and Sheridan Drive. Site Features: Several large buildings in various stages of decay were demolished and removed from the site by Erie County in 2013. The remediation area was located directly behind the structures on the east end of the site. The site is approximately 6.7 acres in size and is on the eastern side of River Road, directly across from the NRG Huntley Power Generation Station and is also adjacent to the Goodyear Dunlop Tire Corporation property. The nearest residential area is located approximately 1,000 feet to the north along Sawyer Avenue. The Niagara River is located approximately 1,000 feet to the west of the site. Several other listed hazardous waste sites are located within 1/4 mile of the Polymer site, including the O-Cell-O site (#915148) to the north, and the Dunlop site (#915018) to the east. Current Zoning/Uses: The site is zoned industrial and is located in a heavily industrialized area of the Town. Historical Use: The facility operated at the site from 1968 through 1988. Its activities included the manufacture of phenolic resins, phenol-formaldehyde resins, plastics, and various rubber products for use in automotive, paint, and coatings industry. Disposal practices at the site included the discharge of un-reacted phenols, phenolic resins, and light hydrocarbons into an on-site lagoon. Historical aerial photos also showed significant volumes of liquids within the former bermed storage tank areas. In addition, there have been several reports of spills from approximately 1977- 1988. In July 1988, a major fire severely damaged the process and tank farm areas of the site. An estimated 70,000 gallons of a phenol/solvent mixture were released during the fire. In 1995, a State funded Remedial Investigation and Feasibility Study (RI/FS) was completed. This investigation characterized the nature and extent of on-site and off-site contamination, and resulted in the March 1996 Record of Decision (ROD) for the site. An emergency removal action was also completed by the US Environmental Protection Agency (EPA) in November 1996. This removal action included the following activities: classification, stabilization, and disposal of a large number of drums of hazardous substances; the cleaning and decontamination of chemical storage tanks; and the removal and proper disposal of all remaining hazardous substances. Remedy construction began in 2005 and was completed in 2006. The soil bio-treatment cell was operated until January 2007 when it was shut down after sampling of the treatment cell soils indicated that there were no appreciable reductions in the contaminants of concern. A ROD Amendment was issued in December 2009 that revised the original remedy to include the excavation and off-site disposal of all residual contamination above commercial use guidance values. This remedy was completed in the Fall of 2011 and is the subject of the approved FER for the site. Site Geology/Hydrology: The site geology is comprised of up to 13 feet of various fill materials (sand, gravel, brick, foundry sand, wood, etc.) over a thick layer (up to 50 feet) of silty clay. The clay is underlain by 5 to 12 feet of gravelly silt which overlies the Camillus Shale bedrock. The bedrock was found at depths between 50 and 67 feet below ground surface (bgs) in on-site borings. Water-bearing zones at the site occurred in the fill unit, the gravelly silt overlying bedrock, and the bedrock. Groundwater in the fill was perched on top of the underlying lower permeability silt unit. The depth to the perched groundwater in fill ranged from about 2 to 10 feet bgs across the site. Shallow and intermediate groundwater at the site flows to the west, and that the deep groundwater flows to the south and east. The thick silty clay layer has a low permeability, and therefore it greatly reduces the potential for contaminant migration into the deeper groundwater.

**Assessment:**

Remediation at the site is complete and long term site management is ongoing. Prior to remediation, the primary contaminants of concern were volatile organic chemicals and semi-volatile organic compounds in groundwater and soil.

**Site Class Desc:**

This classification is assigned to a site that has been properly closed but that requires continued site management consisting of operation, maintenance and/or monitoring. Class 4 is appropriate for a site where remedial construction actions have been completed for all operable units, but the site has not necessarily been brought into compliance with standards, criteria, or guidance (e.g., a groundwater extraction and treatment system has been installed and is operating properly but groundwater standards have not been achieved yet). The Record of Decision should define the remedial action objectives that need to be achieved during site management. If a Certificate of Completion (CoC) is to be issued for a site, the CoC is issued concurrently with the reclassification.

**Site Class Desc (GIS):** This classification is assigned to a site that has been properly closed but that requires continued site management consisting of operation, maintenance and/or monitoring. Class 4 is appropriate for a site where remedial construction actions have been completed for all operable units, but the site has not necessarily been brought into compliance with standards, criteria, or guidance (e.g., a groundwater extraction and treatment system has been installed and is operating properly but groundwater standards have not been achieved yet). The Record of Decision should define the remedial action objectives that need to be achieved during site management. If a Certificate of Completion (CoC) is to be issued for a site, the CoC is issued concurrently with the reclassification.

**Source of Data:** Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e., State Superfund, Brownfield Cleanp, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are included in this database. The Database also includes the "Registry of Institutional and Engineering Controls in New York State". Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

**Assess DOH:** The site is fenced to restrict public access. A modified NYSDEC Part 360 closure was completed which covered and capped contaminated soil with 18 inches of compacted clay and 6 inches of soil. Therefore, the potential for

Map Key	Number of Records	Direction	Distance (mi/ft)	Elev/Diff (ft)	Site	DB
---------	-------------------	-----------	------------------	----------------	------	----

direct contact by on-site workers to contaminated soil has been eliminated. Industrial wells are prevalent along River Road, however, the area is served by public water so exposures via drinking water are not expected.

**Description:**

Location: The Dunlop Tire and Rubber Site, now Sumitomo, consists of three landfills that cover an area of approximately 25 acres of the 130 acre Goodyear Dunlop Tires North America, Ltd, now Sumitomo, at the intersection of Sheridan Drive and River Road in the Town of Tonawanda, Erie County. The site is bounded by industrial properties and Sawyer Avenue to the north, Kenmore Avenue and Route 290 to the east, Sheridan Drive to the south, and River Road to the west. Site Features: The topography of the site is relatively flat, with most surface water runoff toward on-site drainage ditches, storm sewers, a SPDES permitted settling pond or adjacent wetlands. The Niagara River is located approximately 1000 feet west of the Site. Current Zoning/Use: The Site is zoned for industrial use, and currently houses an active tire manufacturing facility. Surrounding properties include a mix of commercial, light and heavy industrial, utility right of ways, and residential parcels. Disposal History: The Site contains three separate landfills, designated as Areas A, B and C. Area A is located in the northwest portion of the property, is approximately 13 acres in size, and was utilized until 1979 for the disposal of fly-ash, slag, carbon black, asphalt, foam rubber, tires, coal, spent solvents, and construction and demolition debris. Area B is located in the southwest portion of the property, is approximately 6 acres in size, and was utilized until 1970 for the disposal of scrap rubber, fly-ash, slag, carbon black, foam rubber, amines, antioxidants, plastic, construction demolition debris, and general plant refuse. Area C is located in the eastern portion of the property, is approximately 9 acres in size, and was utilized until 1973 for the disposal of coal ash, fly-ash, slag, carbon black, and spent solvents. Remedial History: A preliminary assessment of the site was completed in 1982 by the U.S. Geological Survey. During 1982 and 1983 Dunlop conducted a more comprehensive investigation by installing monitoring wells, excavating test pits to delineate the extent of the landfills, and by sampling and analyzing surface soil, subsurface soil, surface water, and groundwater. In 1985 Dunlop collected additional groundwater and surface water samples. During 1991, under an Order on Consent, Dunlop installed additional monitoring wells, excavated additional test trenches to better delineate the extent of the landfills, and sampled and analyzed groundwater and sediment. In March 1993, the NYSDEC issued a Record of Decision (ROD) for the Site. During 1993 and 1994 the three landfills were capped with modified Part 360 clay caps that consisted of 18 inches of compacted clay covered with 6 inches of soil. Site Geology and Hydrogeology: Four distinct geologic units exist at the Dunlop Tire and Rubber Site. The uppermost unit is fill material consisting predominantly of production wastes, off-specification products, miscellaneous plant wastes, flyash, slag and coal. These materials are up to 12 feet thick. Underlying the fill material is a dense, low permeability (meaning that groundwater cannot easily move through it) glaciolacustrine silty clay with an approximate thickness of 53 feet. Below the silty clay deposit is a dense glacial till approximately 10 feet thick. The permeability of this unit is also very low. Shale bedrock of the Camillus Shale Formation was encountered at depths ranging from 62.5 to 74.2 feet. Shallow groundwater is generally encountered within the fill material at the Site, and generally flows to the west toward the Niagara River. This water is perched (located) on top of the glaciolacustrine deposit because of this unit's low permeability. Groundwater from the Camillus Shale Formation is not utilized as a source of drinking water in the Tonawanda area because of naturally occurring high mineral content and the close proximity of the Niagara River, an important source of municipal drinking water throughout the Western New York area. Groundwater flow in the upper bedrock aquifer is also to the west toward the Niagara River. Site Management: Long-term maintenance and monitoring (Site Management) of the landfill caps is on-going. Site Management activities include annual inspections, annual groundwater quality monitoring, and maintenance of the caps. Periodic Review Reports, along with an Institutional Control/Engineering Control certification, are submitted to the NYSDEC annually. Groundwater monitoring to date, indicates that the remedy remains protective of public health and the environment.

**Assessment:**

The three landfills were properly closed with modified Part 360 clay caps to reduce infiltration of precipitation into the waste, thereby reducing contaminant migration from the landfills. The caps are maintained and monitored. Long-term groundwater monitoring results indicate that the remedy remains protective of the environment.

<b>Site Class Desc:</b>	This classification is assigned to a site that has been properly closed but that requires continued site management consisting of operation, maintenance and/or monitoring. Class 4 is appropriate for a site where remedial construction actions have been completed for all operable units, but the site has not necessarily been brought into compliance with standards, criteria, or guidance (e.g., a groundwater extraction and treatment system has been installed and is operating properly but groundwater standards have not been achieved yet). The Record of Decision should define the remedial action objectives that need to be achieved during site management. If a Certificate of Completion (CoC) is to be issued for a site, the CoC is issued concurrently with the reclassification.

<b>Source of Data:</b>	Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e., State Superfund, Brownfield Cleanp, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are include in this database. The Database also includes the "Registry of Institutional and Engineering Controls in New York State". Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.					
<b>Assess DOH:</b>	The site is fenced to restrict public access. A modified NYSDEC Part 360 closure was completed which covered and capped contaminated soil with 18 inches of compacted clay and 6 inches of soil. Therefore, the potential for direct contact by on-site workers to contaminated soil has been eliminated. Industrial wells are prevalent along River Road, however, the area is served by public water so exposures via drinking water are not expected.					
<b>Description:</b>	Location: The Dunlop Tire and Rubber Site, now Sumitomo, consists of three landfills that cover an area of approximately 25 acres of the 130 acre Goodyear Dunlop Tires North America, Ltd, now Sumitomo, at the intersection of Sheridan Drive and River Road in the Town of Tonawanda, Erie County. The site is bounded by industrial properties and Sawyer Avenue to the north, Kenmore Avenue and Route 290 to the east, Sheridan Drive to the south, and River Road to the west. Site Features: The topography of the site is relatively flat, with most surface water runoff toward on-site drainage ditches, storm sewers, a SPDES permitted settling pond or adjacent wetlands. The Niagara River is located approximately 1000 feet west of the Site. Current Zoning/Use: The Site is zoned for industrial use, and currently houses an active tire manufacturing facility. Surrounding properties include a mix of commercial, light and heavy industrial, utility right of ways, and residential parcels. Disposal History: The Site contains three separate landfills, designated as Areas A, B and C. Area A is located in the northwest portion of the property, is approximately 13 acres in size, and was utilized until 1979 for the disposal of fly-ash, slag, carbon black, asphalt, foam rubber, tires, coal, spent solvents, and construction and demolition debris. Area B is located in the southwest portion of the property, is approximately 6 acres in size, and was utilized until 1970 for the disposal of scrap rubber, fly-ash, slag, carbon black, foam rubber, amines, antioxidants, plastic, construction demolition debris, and general plant refuse. Area C is located in the eastern portion of the property, is approximately 9 acres in size, and was utilized until 1973 for the disposal of coal ash, fly-ash, slag, carbon black, and spent solvents. Remedial History: A preliminary assessment of the site was completed in 1982 by the U.S. Geological Survey. During 1982 and 1983 Dunlop conducted a more comprehensive investigation by installing monitoring wells, excavating test pits to delineate the extent of the landfills, and by sampling and analyzing surface soil, subsurface soil, surface water, and groundwater. In 1985 Dunlop collected additional groundwater and surface water samples. During 1991, under an Order on Consent, Dunlop installed additional monitoring wells, excavated additional test trenches to better delineate the extent of the landfills, and sampled and analyzed groundwater and sediment. In March 1993, the NYSDEC issued a Record of Decision (ROD) for the Site. During 1993 and 1994 the three landfills were capped with modified Part 360 clay caps that consisted of 18 inches of compacted clay covered with 6 inches of soil. Site Geology and Hydrogeology: Four distinct geologic units exist at the Dunlop Tire and Rubber Site. The uppermost unit is fill material consisting predominantly of production wastes, off-specification products, miscellaneous plant wastes, flyash, slag and coal. These materials are up to 12 feet thick. Underlying the fill material is a dense, low permeability (meaning that groundwater cannot easily move through it) glaciolacustrine silty clay with an approximate thickness of 53 feet. Below the silty clay deposit is a dense glacial till approximately 10 feet thick. The permeability of this unit is also very low. Shale bedrock of the Camillus Shale Formation was encountered at depths ranging from 62.5 to 74.2 feet. Shallow groundwater is generally encountered within the fill material at the Site, and generally flows to the west toward the Niagara River. This water is perched (located) on top of the glaciolacustrine deposit because of this unit's low permeability. Groundwater from the Camillus Shale Formation is not utilized as a source of

drinking water in the Tonawanda area because of naturally occurring high mineral content and the close proximity of the Niagara River, an important source of municipal drinking water throughout the Western New York area. Groundwater flow in the upper bedrock aquifer is also to the west toward the Niagara River. Site Management: Long-term maintenance and monitoring (Site Management) of the landfill caps is on-going. Site Management activities include annual inspections, annual groundwater quality monitoring, and maintenance of the caps. Periodic Review Reports, along with an Institutional Control/Engineering Control certification, are submitted to the NYSDEC annually. Groundwater monitoring to date, indicates that the remedy remains protective of public health and the environment.

**Assessment:**

The three landfills were properly closed with modified Part 360 clay caps to reduce infiltration of precipitation into the waste, thereby reducing contaminant migration from the landfills. The caps are maintained and monitored. Long-term groundwater monitoring results indicate that the remedy remains protective of the environment.

The Record of Decision should define the remedial action objectives that need to be achieved during site management. If a Certificate of Completion (CoC) is to be issued for a site, the CoC is issued concurrently with the reclassification.

**Source of Data:** Remedial Sites Data set: This database contains records of the sites which have been remediated or are being managed under one of DER's remedial programs (i.e., State Superfund, Brownfield Cleanup, etc.). All sites listed on the "Registry of Inactive Hazardous Waste Disposal Sites in New York State" are included in this database. The Database also includes the "Registry of Institutional and Engineering Controls in New York State". Remedial GIS Data set: This dataset includes a single point location for a subset of sites which are currently included in one of the Remedial Programs being overseen by the Division of Environmental Remediation.

**Description:**

Location: The Dunlop Tire and Rubber Site, now Sumitomo, consists of three landfills that cover an area of approximately 25 acres of the 130 acre Goodyear Dunlop Tires North America, Ltd, now Sumitomo, at the intersection of Sheridan Drive and River Road in the Town of Tonawanda, Erie County. The site is bounded by industrial properties and Sawyer Avenue to the north, Kenmore Avenue and Route 290 to the east, Sheridan Drive to the south, and River Road to the west. Site Features: The topography of the site is relatively flat, with most surface water runoff toward on-site drainage ditches, storm sewers, a SPDES permitted settling pond or adjacent wetlands. The Niagara River is located approximately 1000 feet west of the Site. Current Zoning/Use: The Site is zoned for industrial use, and currently houses an active tire manufacturing facility. Surrounding properties include a mix of commercial, light and heavy industrial, utility right of ways, and residential parcels. Disposal History: The Site contains three separate landfills, designated as Areas A, B and C. Area A is located in the northwest portion of the property, is approximately 13 acres in size, and was utilized until 1979

for the disposal of fly-ash, slag, carbon black, asphalt, foam rubber, tires, coal, spent solvents, and construction and demolition debris. Area B is located in the southwest portion of the property, is approximately 6 acres in size, and was utilized until 1970 for the disposal of scrap rubber, fly-ash, slag, carbon black, foam rubber, amines, antioxidants, plastic, construction demolition debris, and general plant refuse. Area C is located in the eastern portion of the property, is approximately 9 acres in size, and was utilized until 1973 for the disposal of coal ash, fly-ash, slag, carbon black, and spent solvents. Remedial History: A preliminary assessment of the site was completed in 1982 by the U.S. Geological Survey. During 1982 and 1983 Dunlop conducted a more comprehensive investigation by installing monitoring wells, excavating test pits to delineate the extent of the landfills, and by sampling and analyzing surface soil, subsurface soil, surface water, and groundwater. In 1985 Dunlop collected additional groundwater and surface water samples. During 1991, under an Order on Consent, Dunlop installed additional monitoring wells, excavated additional test trenches to better delineate the extent of the landfills, and sampled and analyzed groundwater and sediment. In March 1993, the NYSDEC issued a Record of Decision (ROD) for the Site. During 1993 and 1994 the three landfills were capped with modified Part 360 clay caps that consisted of 18 inches of compacted clay covered with 6 inches of soil. Site Geology and Hydrogeology: Four distinct geologic units exist at the Dunlop Tire and Rubber Site. The uppermost unit is fill material consisting predominantly of production wastes, off-specification products, miscellaneous plant wastes, flyash, slag and coal. These materials are up to 12 feet thick. Underlying the fill material is a dense, low permeability (meaning that groundwater cannot easily move through it) glaciolacustrine silty clay with an approximate thickness of 53 feet. Below the silty clay deposit is a dense glacial till approximately 10 feet thick. The permeability of this unit is also very low. Shale bedrock of the Camillus Shale Formation was encountered at depths ranging from 62.5 to 74.2 feet. Shallow groundwater is generally encountered within the fill material at the Site, and generally flows to the west toward the Niagara River. This water is perched (located) on top of the glaciolacustrine deposit because of this unit's low permeability. Groundwater from the Camillus Shale Formation is not utilized as a source of drinking water in the Tonawanda area because of naturally occurring high mineral content and the close proximity of the Niagara River, an important source of municipal drinking water throughout the Western New York area. Groundwater flow in the upper bedrock aquifer is also to the west toward the Niagara River. Site Management: Long-term maintenance and monitoring (Site Management) of the landfill caps is on-going. Site Management activities include annual inspections, annual groundwater quality monitoring, and maintenance of the caps. Periodic Review Reports, along with an Institutional Control/Engineering Control certification, are submitted to the NYSDEC annually. Groundwater monitoring to date, indicates that the remedy remains protective of public health and the environment.

**Assessment:**

The three landfills were properly closed with modified Part 360 clay caps to reduce infiltration of precipitation into the waste, thereby reducing contaminant migration from the landfills. The caps are maintained and monitored. Long-term groundwater monitoring results indicate that the remedy remains protective of the environment.
