White Lake Granite Mine Incomplete Items:

1. Describe and illustrate in the narrative and Mining Plan Map all erosion and sediment control structures that will be installed to retain all storm water on site, if any.

2. All soils and overburden stockpiled for reclamation must be stored within the permit term area (affected area) which is ultimately in the life of mine.

3. Describe and illustrate in the narrative and Mining Plan Map a general location of the portable processing plant and stockpiles.

4. Include in the blasting section that all blast events will be monitored with a seismograph at the property line, or a nearby receptor if a complaint is received.

5. Describe the final grade of all slopes, besides the vertical bedrock face, during the reclamation process.

6. The Department does not anticipate any significant impacts from mining activities during the proposed hours of operations, except drilling and blasting activities. Revise hours of operation for these activities.

7. The proposed application illustrates all excavation within a 5.2 acre area of the 26.7 acre life of mine. Does the applicant anticipate excavating outside the 5.2 acre area in the future for granite reserves or unconsolidated minerals within the life of mine? If so, the modification would need to be reviewed through SEQRA.
