Species Status Assessment

Class: Actinopterygii
Family: Centrarchidae
Scientific Name: Acantharchus pomotis
Common Name: Mud sunfish

Species synopsis:
The mud sunfish is a freshwater fish found in low gradient creeks and rivers, weedy ponds, bogs, and lakes with mud or silt bottoms (Werner 2004, NatureServe 2013). In New York, it was historically found in the Hackensack River in Rockland County, but may now be extirpated. New York is at the northern edge of the range, which extends along the Atlantic Coastal Plain of the United States as far south as Florida (Smith 1985, NatureServe 2013). Populations are likely in decline due to habitat modification (NatureServe 2013).

I. Status

   a. Current and Legal Protected Status
      i. Federal ___________________________ Candidate? __ No __
      ii. New York ________________

   b. Natural Heritage Program Rank
      i. Global __________________________
      ii. New York ____________ Tracked by NYNHP? __ Yes __

Other Rank:
Species of Northeast Regional Conservation Concern (Therres 1999)

Status Discussion:
This species is uncommon, occurring in a narrow range of waters along the east coast. Most populations are stable (NatureServe 2013). In New York, any extant populations may be in decline due to impoundments above and below the habitat where they were historically recorded (Smith 1985).
II. Abundance and Distribution Trends

a. North America
   i. Abundance
      ____ declining  ____ increasing  _X_ stable  ____ unknown
   ii. Distribution:
      ____ declining  ____ increasing  _X_ stable  ____ unknown

Time frame considered:  _Past 20 years (NatureServe 2013)_

b. Regional
   i. Abundance
      ____ declining  ____ increasing  _X_ stable  ____ unknown
   ii. Distribution:
      ____ declining  ____ increasing  _X_ stable  ____ unknown

Regional Unit Considered: _Eastern United States_  
Time Frame Considered: _Past 20 years (NatureServe 2013)_

Monitoring in New York.

There are currently no monitoring efforts.

Trends Discussion:

Populations are in stable throughout much of the species range, but some local populations are in decline (NatureServe 2013). In New York, any remaining populations are likely in decline due to impoundments above and below their habitat on the Hackensack River (Smith 1985, NatureServe 2013).

In 2007, New Jersey proposed fishing regulations that placed restrictions on warmwater pinelands species, including mud sunfish, which prohibit possession. While not a target species for anglers, there is potential for mud sunfish to be captured and no regulations had been in place.
Figure 1: Mud sunfish conservation status in North America (NatureServe 2013).

IV. Primary Habitat or Community Type:

1. Headwater/Creek, Low Gradient

2. Pine Barrens Shrub Swamp

3. Northern White Cedar Swamp
Habitat or Community Type Trend in New York:

- Declining
- Stable
- Increasing
- Unknown

Time frame of decline/increase: Past 20 years (NatureServe 2013)

Habitat Specialist?
- Yes
- No

Indicator Species?
- Yes
- No

Habitat Discussion:

Described as a warmwater pineland species in New Jersey, the mud sunfish prefers darkly stained waters in sluggish lowland streams (prefers pools to runs), wetlands, or lakes with mud bottoms (Smith 1985, Cashner et al. 1989, Werner 2004). It favors acidic waters associated with cedar swamps and pine barrens (NYSDEC 2013).

V. New York Species Demographics and Life History

- Breeder in New York
  - Summer Resident
  - Winter Resident
  - Anadromous
  - Non-breeder in New York
    - Summer Resident
    - Winter Resident
    - Catadromous
  - Migratory only
  - Unknown
Species Demographics and Life History Discussion:

Little is known about this the mud sunfish’s reproductive characteristics (Smith 1985, NYSDEC 2013). It is a nocturnal fish (PNHP 2007, Ryder and Schell 2012). Spawning likely occurs between December and May and males prepare the nest (Pardue 1993). The species is said to make a grunting sound during reproduction which may or may not have a function (Smith 1985, Cashner et al. 1989). A study in Maryland looking at 14 specimens aged the individuals from 2 to 8 years old (Smith 1985). Females can produce approximately 5,000-12,000 eggs (Pardue 1993).

VI. Threats:

There are few threats to this species. Impoundments and draining of wetlands isolates populations and reduces available habitat (Cooper 1983, Smith 1985, NYSDEC 2013). Invasion of non-native species is also a threat to mud sunfish habitat (Brittingham et al. 2005).

Are there regulatory mechanisms that protect the species or its habitat in New York?

_____ No   _____ Unknown

X  Yes

The mud sunfish is listed as a threatened species in New York and is protected by Environmental Conservation Law (ECL) section 11-0535 and the New York Code of Rules and Regulations (6 NYCRR Part 182). A permit is required for any proposed project that may result in a take of a species listed as Threatened or Endangered, including, but not limited to, actions that may kill or harm individual animals or result in the adverse modification, degradation or destruction of habitat occupied by the listed species.

The Protection of Waters Program provides protection for rivers, streams, lakes, and ponds under Article 15 of the NYS Conservation Law.

Describe knowledge of management/conservation actions that are needed for recovery/conservation, or to eliminate, minimize, or compensate for the identified threats:

Research needs to be conducted in order to determine if the mud sunfish is still present in NY. It would be beneficial to preserve small, heavily vegetated bodies of water (NatureServe 2012). Nighttime surveying may be required due to the nocturnal behavior of the species.
Conservation actions following IUCN taxonomy are categorized in the following table.

<table>
<thead>
<tr>
<th>Action Category</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Land/Water Management</td>
<td>Habitat/Natural Process Restoration</td>
</tr>

<td>External Capacity Building</td>
<td>Alliance &amp; Partnership Development</td>
</tr>
</tbody>
</table>

The Comprehensive Wildlife Conservation Strategy (NYSDEC 2005) includes recommendations for the following actions for extirpated fishes, which includes the mud sunfish.

**Habitat Monitoring:**

---- Inventories will be completed in all areas where restoration might be practical.

**Relocation/reintroduction:**

---- Re-establish, if feasible, populations of those endangered fish species now believed to be extirpated from New York.
